

Merchant Integration Guide
COM API (winHTTP 5.1) – v 1.2.3

Revision Number	Date	Description
V1.1.0	January 22, 2007	-Document edited for coherence
V1.1.1	February 16, 2007	-Section 8. Basic Transactions with Extra Fetaures – Added Purchase with VbV/SecureCode example -Appendix F. Method List – Added Moneris.USCavvPurchase & Moneris.USCavvPreauth
V1.1.2	August 3, 2007	-Section 6. Transaction Types and Transaction Flow - added ACH transactions to the process flow - added ACH transaction definitions -Section 7. Basic Transaction Examples – Added Force Post transaction type -Section 9. Mag Swipe Transaction Examples - Added Mag Swipe Force Post transaction type -Section 11. ACH Transaction Examples – Added ACH Transaction Examples -Section 12. ACH Transaction Examples with Extra Features -Added ACH Debit (with Customer and Order details) - ACH Debit (with Recurring Billing) -Section 13. Administrative Transactions – Moved BatchClose & OpenTotals to new section -Section 15. How Do I Test My Solution? -Added new list of test stores -Added test card and bank account details -Section 16. What Do I Need to Include in the Receipt? - Added ACH (Check Present) -Appendix E. AchInfo Fields - Added new section -Appendix G. Method List - Added Moneris.Forcepost - Added Moneris.USForcepost - Added ACH Info Details - Moneris.USAchDebit - Moneris.USAchCredit - Moneris.USAchFiEnquiry -Appendix L. Basic Transaction Receipt (Non Track2) -Added new section with screenshots -Replaced receipt example -Appendix M. Mag Swipe Transaction Receipt (Track2) – Added new section with screenshots -Appendix N. ACH Transaction Confirmation – Added new section with screenshots
V1.1.3	February 11, 2009	-Section 2. System and Skill Requirement – Added PCI & PA-DSS requirements note. -Section 6. Transaction Types and Transaction Flow - added Pinless Debit transactions to the process flow - added Pinless Debit transaction definitions -Section 8. Transaction with Extra features: Purchase with CVD and AVS (eFraud) -Added CVD note. -Section 11. Pinless Debit Transaction Examples – Added Pinless Debit Transaction Examples -Section 12. Pinless Debit Transaction Examples with extra feature – Added New Section -Section 13. ACH Transactions Examples – Added ACH Check Present Example -Section 15. Administrative Transactions – Added Recur Billing Update (Customer Information) -Section 17. How Do I Test My Solution? - Added test card details -Section 18. What Do I Need to Include in the Receipt? - Added Pinless Debit -Appendix A. Definition of Request Fields - Updated pos_code definition - Added CVD note. -Appendix B. Definitions of Response Fields – Added Recur Update response fields -Appendix D. Recur Fields -Added Recur Update Request Fields. -Added Recur Update Response codes. -Appendix E. Pinless Debit Fields – Added new section

		<ul style="list-style-type: none"> -Appendix G. ACH Sec Codes and Process Flow – Added Sec Code definitions and decision flow charts -Appendix H. ProglIDs – removed section -Appendix I. Method List – removed section -Appendix I. Card Validation Digits (CVD) – Added CVD note. -Appendix J. Address Verification Service (AVS) – Merged Visa/MC/Discover Response Code tables -Appendix N. Pinless Debit Transaction Receipt - Added new section with screenshots -Appendix P. ACH Transaction Receipt (Check Physically Present) - Added new section with screenshots
V1.1.4	April 29, 2009	<ul style="list-style-type: none"> -Appendix H. ProglIDs – added section -Appendix I. Method List – added section
V1.1.5	December 10, 2010	<ul style="list-style-type: none"> -Section 13. ACH Transaction Examples – remove ACH Debit (Check Present) example -Appendix I. Method List – added Moneris.USAchReversal -Appendix R. ACH Transaction Receipt (Check Present) – removed section
V1.2.0	June 22, 2011	<ul style="list-style-type: none"> -Section 2. System and Skill Requirement – Updated PCI & PA-DSS requirements note. -Section 6. Transaction Types and Transaction Flow <ul style="list-style-type: none"> -Added Process Flow for PreAuth/ReAuth/Capture Transactions -Added Card Verification & ReAuth transaction definitions -Section 7. Basic Transaction Examples <ul style="list-style-type: none"> -PreAuth (basic) - Added PreAuth reversal note -Added ReAuth example -Capture - Added PreAuth reversal note -Added Dynamic Descriptor to examples -Added CardLevelResult to examples -Section 8. Basic Transaction with Extra Features <ul style="list-style-type: none"> -Added Dynamic Descriptor to examples -Added CardLevelResult to examples -Section 9. Mag Swipe Transaction Examples <ul style="list-style-type: none"> -Added Dynamic Descriptor to examples -Added CardLevelResult to examples -Section 10. Mag Swipe Transactions with Extra Features <ul style="list-style-type: none"> -Added Dynamic Descriptor -Added CardLevelResult -Section 15. Administrative Transactions – Added Card Verification example -Section 21. How Do I Get Help? – Updated contact phone numbers and email addresses -Appendix A. Definition of Request Fields <ul style="list-style-type: none"> -Added orig_order_id -Added dynamic_descriptor -Appendix B. Definitions of Response Fields – Added CardLevelResult -Appendix D. Recur and Recur Update Fields – Added new 'eom' (end of month) recur_unit -Appendix L. Card Level Result Value – Added new section with definition table
V1.2.1	December 13, 2011	<ul style="list-style-type: none"> -Appendix K. Card Validation Digits (CVD) – Added American Express response codes -Appendix M. Address Verification Services(AVS) – Added American Express/JCB response codes -Appendix N. Additional Information for CVD and AVS – Added American Express
V1.2.2	August 31, 2012	<ul style="list-style-type: none"> -New download link updated in various locations: https://developer.moneris.com/ -Section 6. Transaction Types and Transaction Flow – Added Encrypted Mag Swipe Credit Card Transactions -Section 7. Basic Transactions – Added note to Independent Refund -Section 8. Transaction with Extra features <ul style="list-style-type: none"> -Added CavvResultCode to Purchase(with VbV/MasterCard SecureCode) -Added Purchase (with Status Check) -Section 9. Mag Swipe Transactions – Added note to Mag Swipe Independent Refund -Section 11. Encrypted Mag Swipe Transactions – Added new section with examples -Section 12. Encrypted Mag Swipe Transactions with Extra Features – Added new section with examples

		<ul style="list-style-type: none"> -Appendix A. Definition of Request Fields <ul style="list-style-type: none"> -Added status_check request field -Added enc_track2 -Added device_type -Appendix B. Definitions of Response Fields <ul style="list-style-type: none"> -Added MaskedPan response field -Added StatusCode response field -Added StatusMsg response field -Added CavvResultCode response. -Appendix I. Method List <ul style="list-style-type: none"> - Added Moneris.USCardVerify - Added Moneris.USReauth - Moneris.USEncTrack2Purchase - Moneris.USEncTrack2Preauth - Moneris.USEncTrack2IndependentRefund -Appendix N. Card Level Result value – Updated table with new values - Appendix O. CAVV Result Code - New section addition.
V1.2.3	November 12, 2012	<ul style="list-style-type: none"> -Section 6. Transaction Types and Transaction Flow – Added Encrypted Credit Card Transactions -Section 9. Encrypted Transactions – Added new section with examples -Section 10. Encrypted Transactions with Extra Features – Added new section with examples -Section 13. Encrypted Mag Swipe Transactions – Added Encrypted Mag Swipe Forcepost transaction type -Section 19. Administrative Transactions – Added Encrypted Card Verification transaction type -Appendix H. ProglDs <ul style="list-style-type: none"> -Added Moneris.USForcepost -Moneris.USEncPurchase -Moneris.USEncPreauth -Moneris.USEncIndRefund -Moneris.USEncCardVerification -Moneris.USEncForcePost -Moneris.USTrack2Forcepost -Moneris.USEncTrack2ForcePost -Appendix I. Method List <ul style="list-style-type: none"> -Added Moneris.USForcepost -Moneris.USEncPurchase -Moneris.USEncPreauth -Moneris.USEncIndRefund -Moneris.USEncCardVerification -Moneris.USEncForcePost -Moneris.USTrack2Forcepost -Moneris.USEncTrack2ForcePost

****** PLEASE READ CAREFULLY******

You have a responsibility to protect cardholder and merchant related confidential account information. Under no circumstances should ANY confidential information be sent via email while attempting to diagnose integration or production issues. When sending sample files or code for analysis by Moneris staff, all references to valid card numbers, merchant accounts and transaction tokens should be removed and or obscured. Under no circumstances should live cardholder accounts be used in the test environment.

1. About this Documentation

This document describes the basic information for using the COM API for sending credit card transactions. In particular, it describes the format for sending transactions and the corresponding responses you will receive.

2. System and Skill Requirements

In order to use the COM API your system will need to have the following:

1. Port 443 open
 2. Web server with an SSL certificate
 3. WinHTTP 5.1 (Please note that this will not work with winHTTP 5.0)
- (Note: Core SDK is no longer required)

As well, you will need to have the following knowledge and/or skill set:

1. Permissions to register a dll
2. Knowledge of a COM compatible language (ASP or VBscript)

Note:

It is important to note that all Merchants and Service Providers that store, process, or transmit cardholder data must comply with PCI DSS and the Card Association Compliance Programs. However, certification requirements vary by business and are contingent upon your "Merchant Level" or "Service Provider Level". Failure to comply with PCI DSS and the Card Association Compliance Programs may result in a Merchant being subject to fines, fees or assessments and/or termination of processing services. Non-compliant solutions may prevent merchants boarding with Moneris Solutions.

As a Moneris Solutions client or partner using this method of integration, your solution must demonstrate compliance to the Payment Card Industry Data Security Standard (PCI DSS) and/or the Payment Application Data Security Standard (PA DSS). These standards are designed to help the cardholders and merchants in such ways as they ensure credit card numbers are encrypted when transmitted/stored in a database and that merchants have strong access control measures.

For further information on PCI DSS and PA DSS requirements, please visit <http://www.pcisecuritystandards.org>.

For more information on how to get your application PCI-DSS compliant, please contact our Integration Specialists and visit <https://developer.moneris.com> to download the PCI-DSS Implementation Guide.

3. Verified by Visa

Verified by Visa (VbV) is a program initiated by Visa. Before approving a transaction eSELECTplus and the Bank that issues the Visa credit cards will attempt to authenticate the cardholder through the use of a password, similar to a debit PIN. When an authentication is attempted the merchant is protected from chargebacks.

If you have enrolled in Verified by Visa (VbV) with Moneris and eSELECTplus, please also refer to the *COM VbV / SecureCode MPI* document found at: <https://developer.moneris.com>

4. MasterCard SecureCode

MasterCard SecureCode (MCSC) is a new feature offered by MasterCard. Merchants who have enrolled in this program with Moneris and eSELECTplus will be able to offer their customers added protection against unauthorized credit card use, as well as protect themselves from fraud-related chargebacks. Cardholders that have applied for SecureCode with their issuing bank will be able to use this password similar to a debit PIN number for online transactions with participating online merchants.

Before approving a transaction, eSELECTplus and the Bank that issued the MasterCard will authenticate the cardholder through the use of this password. For merchants who have enrolled in SecureCode, please also refer to the *COM VbV / SecureCode MPI* document found at: <https://developer.moneris.com>

5. What is the Process I will need to follow?

You will need to follow these steps.

1. Do the required development as outlined in this document
2. Test your solution in the test environment
3. Activate your store
4. Make the necessary changes to move your solution from the test environment into production as outlined in this document

6. Transaction Types and Transaction Flow

eSELECTplus supports a wide variety of transactions through the API. Below is a list of transactions supported by the API, other terms used for the transaction type are indicated in brackets.

Basic Transactions

Purchase – (sale) The Purchase transaction verifies funds on the customer's card, removes the funds and readies them for deposit into the merchant's account.

PreAuth – (authorisation / preauthorisation) The PreAuth verifies and locks funds on the customer's credit card. The funds are locked for a specified amount of time, based on the card issuer. To retrieve the funds from a PreAuth so that they may be settled in the merchant's account a Capture must be performed.

ReAuth – (reauthorisation) A PreAuth may only be Captured once. If the PreAuth is Captured for less than the original amount, the ReAuth will allow the merchant to verify and lock the remaining funds on the customer's credit card, so they may also be Captured. To retrieve the funds from a ReAuth so that they may be settled in the merchant's account, a Capture must be performed.

Capture – (Completion / PreAuth Completion) Once a PreAuth is obtained the funds that are locked need to be retrieved from the customer's credit card. The Capture retrieves the locked funds and readies them for settlement into the merchant's account.

Void – (Correction / Purchase Correction) Purchases and Captures can be voided the same day* that they occur. A Void must be for the full amount of the transaction and will remove any record of it from the cardholder's statement.

Refund – (Credit) A Refund can be performed against a Purchase or a Capture to refund any part, or all of the transaction.

Independent Refund – (Credit) An Independent Refund can be performed to credit money to a Credit Card. This transaction does not require a prior Purchase or Capture. Please note, the Independent Refund transaction may or may not be supported on your account. If you receive a transaction not allowed error when attempting an independent refund, it may mean the transaction is not supported on your account. If you wish to have the Independent Refund transaction type temporarily enabled (or re-enabled), please contact the Service Centre at 1-800-471-9511.

Force Post (Offline Sale) - The Force Post is used when a merchant obtains the authorization number directly from the issuer using a phone or any third party authorization method. The Force Post retrieves the locked funds and readies them for settlement into the merchant's account.

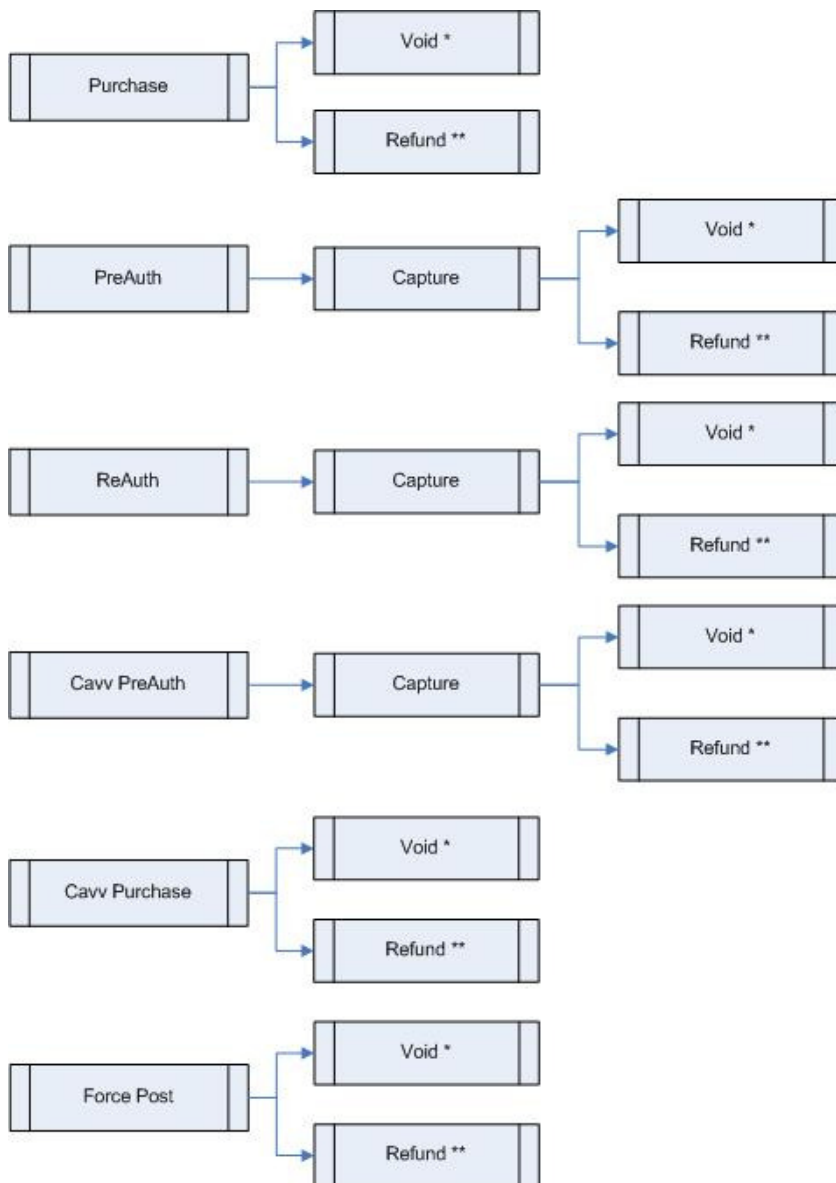

Batch Close – (End of Day / Settlement) When a Batch Close is performed it takes the monies from all Purchase, Capture and Refund transactions so they will be deposited or debited the following business day. For funds to be deposited the following business day the batch must close before 11pm EST.

Open Totals – (Current Batch Report) When an Open Totals is performed it returns the details about the currently open Batch. This transaction is similar to the Batch Close, though it does not close the Batch for settlement.

Card Verification – (Account Status Inquiry) Card Verification verifies the validity of the credit card, expiry date and any additional details, such as the Card Verification Digits or Address Verification details. It does not verify the available amount or lock any funds on the credit card.

* A Void can be performed against a transaction as long as the batch that contains the original transaction remains open.

Process Flow for Basic Credit Card Transactions

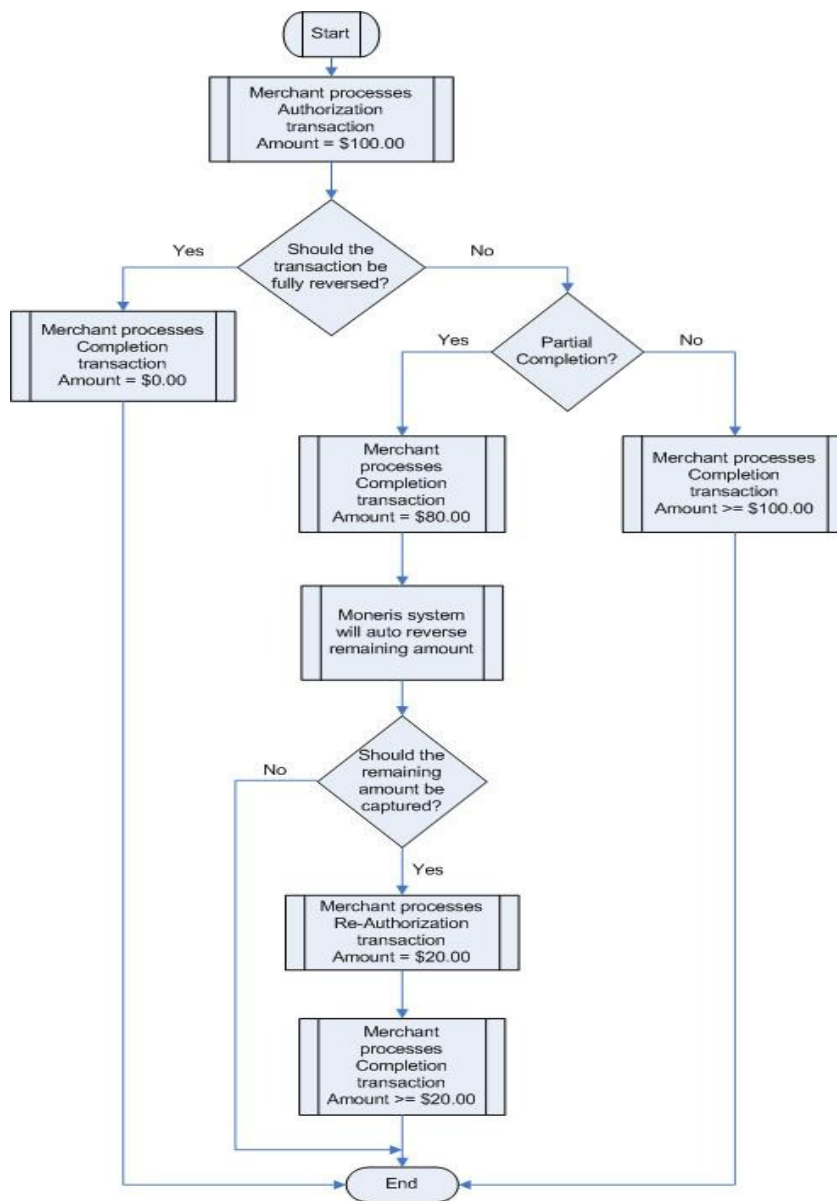

Transactions with no Follow-on required

* Prior to the Batch closing

** After Batch is closed

Process Flow for PreAuth / ReAuth / Capture Transactions

Encrypted Transactions

The following Encrypted Transactions are available:

- Encrypted Purchase (sale)
- Encrypted PreAuth (authorisation / preauthorisation)
- Encrypted Independent Refund (Credit)
- Encrypted Force Post (Offline Sale)
- Encrypted Card Verification (Account Status Inquiry)

These transaction types are identical to those listed above in the Basic Transaction set, but in this case the card data must be entered via a Moneris provided encrypted MSR device.

NOTE

Please note, the Encrypted Transactions may only be used with a Moneris provided encrypted mag swipe reader. To enquire about the encrypted MSR, please call the Service Centre at 1-866-423-8475.

This transaction set applies to card not present transactions. Please refer to the Encrypted Mag Swiped Transactions for the swiped and manually keyed card present transaction set.

Process Flow for Encrypted Credit Card Transactions

Transactions with no Follow-on required

* Prior to the Batch closing

** After Batch is closed

Mag Swipe Transactions

Mag Swipe Purchase – (sale) The Mag Swipe Purchase transaction requires a credit card to be swiped. It then verifies funds on the customer's card, removes the funds and readies them for deposit into the merchant's account.

Mag Swipe PreAuth – (authorisation / preauthorisation) The Mag Swipe PreAuth requires a credit card to be swiped. It then verifies and locks funds on the customer's credit card. The funds are locked for a specified amount of time, based on the card issuer. To retrieve the funds from a Mag Swipe PreAuth so that they may be settled in the merchant's account a Mag Swipe Capture must be performed.

Mag Swipe Capture – (Completion / PreAuth Completion) Once a Mag Swipe PreAuth is obtained the funds that are locked need to be retrieved from the customer's credit card. The Mag Swipe Capture retrieves the locked funds and readies them for settlement into the merchant's account.

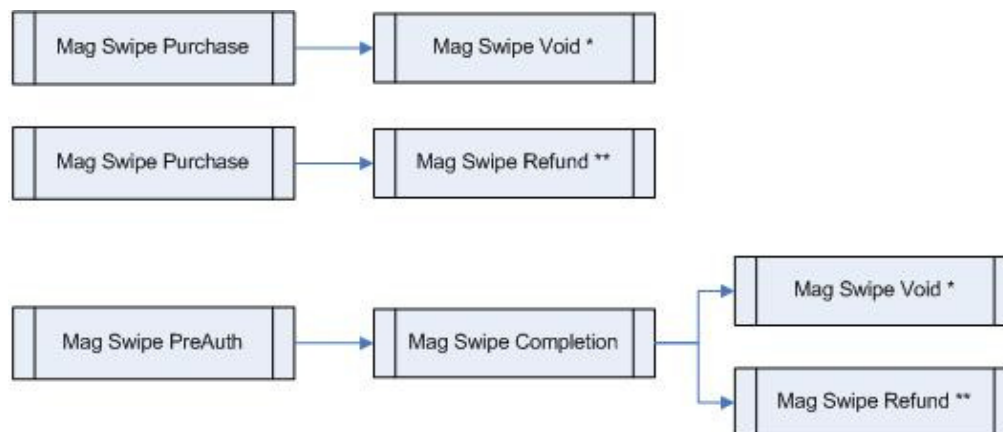

Mag Swipe Void – (Correction / Purchase Correction) Mag Swipe Purchases and Mag Swipe Captures can be voided the same day* that they occur. A Mag Swipe Void must be for the full amount of the transaction and will remove any record of it from the cardholder's statement.

Mag Swipe Refund – (Credit) A Mag Swipe Refund can be performed against a Mag Swipe Purchase or a Mag Swipe Capture to refund any part, or all of the transaction.

Mag Swipe Independent Refund – (Credit) A Mag Swipe Independent Refund requires a credit card to be swiped. It can be performed to credit money to this particular credit card. This transaction does not require a prior Mag Swipe Purchase or Mag Swipe Capture. Please note, the Independent Refund transaction may or may not be supported on your account. If you receive a transaction not allowed error when attempting an independent refund, it may mean the transaction is not supported on your account. If you wish to have the Independent Refund transaction type temporarily enabled (or re-enabled), please contact the Service Centre at 1-800-471-9511.

* A Void can be performed against a transaction as long as the batch that contains the original transaction remains open.

Process Flow for Mag Swipe Credit Card Transactions

Transactions with no Follow-on required

* Prior to the Batch closing

** After Batch is closed

Encrypted Mag Swipe Transactions

The following Encrypted Mag Swipe Transactions are available:

- Encrypted Mag Swipe Purchase (sale)
- Encrypted Mag Swipe PreAuth (authorisation / preauthorisation)
- Encrypted Mag Swipe Independent Refund (Credit)
- Encrypted Mag Swipe Force Post (Offline Sale)

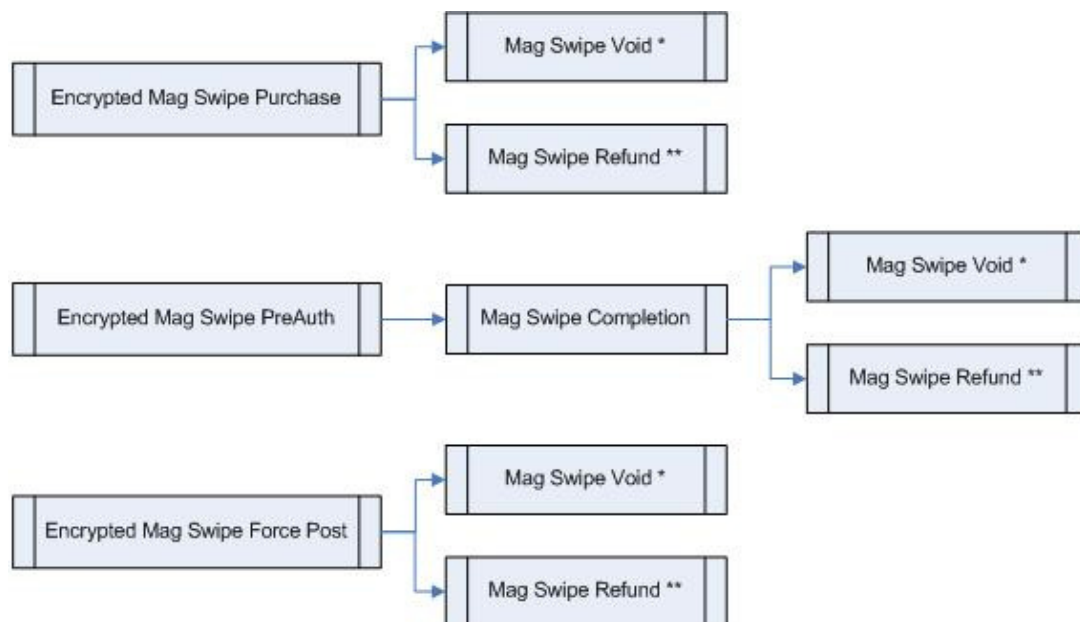

These transaction types are identical to those listed above in the Mag Swipe Transaction set, but in this case the card data must be swiped or keyed in via a Moneris provided encrypted mag swipe reader

NOTE

Please note, the Encrypted Mag Swipe Transactions may only be used with a Moneris provided encrypted mag swipe reader. To enquire about the encrypted MSR, please call the Service Centre at 1-866-423-8475.

Process Flow for Encrypted Mag Swipe Credit Card Transactions

Transactions with no Follow-on required

* Prior to the Batch closing

** After Batch is closed

Pinless Debit Transactions

Pinless Debit Purchase – (sale) A Pinless Debit Purchase transaction verifies funds on the customer's card, removes the funds and readies them for deposit into the merchant's account

Pinless Debit Refund – (Credit) A Pinless Debit Refund transaction can be performed against a Pinless Debit Purchase. No amount is required because the Pinless Debit Refund is always for the full amount of the original transaction.

Process Flow for Pinless Debit Transactions

* Prior to the Batch closing

ACH Transactions

ACH Debit – The ACH Debit transaction verifies and collects the customer's bank account information, removes the funds directly from their bank account and readies them for deposit into the merchant's account.

ACH Reversal – The ACH Reversal transaction can be performed against a previously completed ACH Purchase transaction, the full amount of the original ACH Debit transaction will be refunded. An ACH Reversal may only be performed as long as the ACH Debit was performed within the last 3 months.

ACH Credit – The ACH Credit transaction verifies and collects the customer's bank account information to allow the merchant to transfer funds from their own bank account directly into the customer's bank.

ACH Financial Inquiry – The ACH Fi Inquiry allows the merchant to submit a routing number and verify which Financial Institution it belongs to. This transaction also allows the merchant to verify whether or not this is a valid routing number before submitting an ACH Debit or Credit transaction.

Process Flow for ACH Transactions

Transactions with no Follow-on required

* Prior or After the Batch closing

7. Basic Transaction Examples

Included below is the sample code that can be found in the "Examples" folder of the COM API download.

Purchase (basic)

In the Purchase example we require several variables (store_id, api_token, order_id, amount, pan, expiry_date, and crypt). There are also a number of optional fields, such as cust_id, dynamic_descriptor, and two optional Level 2 variables (commcards_invoice and commcards_tax_amount) available for Corporate Purchasing Cards. Please refer to Appendix A. Definition of Request Fields for variable definitions.

```
<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%
    store_id = "monusqa002"
    api_token = "qatoken"

    order_id = "purch-" & Day(Date) & Month(Date) & Year(Date) & "-" & Hour(Now) & Minute(Now) & Second(Now)
    amount="5.00"
    pan="5454545454545454"
    exp_date = "1111"
    cust_id = "cust_id"
    crypt_type="7"

    dynamic_descriptor = "12345"

    Set out = server.CreateObject("Moneris.USRequest")
    out.initRequest store_id, api_token, "https://esplusqa.moneris.com/gateway_us/servlet/MpgRequest"

    Set request1 = server.CreateObject("Moneris.USBurchase")
    request1.setCustId cust_id
    request1.setDynamicDescriptor dynamic_descriptor

    out.setRequest request1.formatRequest(order_id, amount, pan, exp_date, crypt_type)
    out.sendRequest
%>

<HTML>
<HEAD>
<META HTTP-EQUIV="Content-Type" Content="text-html; charset=Windows-1252">
</HEAD>
<BODY bgcolor=white>

<%
    Response.Write "Receipt ID: " & out.getReceiptID & "<br>"
    Response.Write "Response Code: " & out.getResponseCode & "<br>"
    Response.Write "Transaction Type: " & out.getTransType & "<br>"
    Response.Write "Message: " & out.getMessage & "<br>"
    Response.Write "Amount: " & out.getTransAmount & "<br>"

    Response.Write "Ticket: " & out.getTicket & "<br>"
    Response.Write "CardLevelResult: " & out.getCardLevelResult & "<br>"
%>

</BODY>
</HTML>
```

PreAuth (basic)

The PreAuth is virtually identical to the Purchase with the exception of the transaction type. It is 'USPreAuth' instead of 'USPurchase'. Like the Purchase example, PreAuth's require several variables (store_id, api_token, order_id, amount, pan, expiry_date, and crypt). There are also optional fields, such as cust_id and dynamic_descriptor. Please refer to Appendix A. Definition of Request Fields for variable definitions.

A PreAuth transaction **must** be reversed if it is not to be captured. To reverse an authorization, please refer to the Capture transaction. If you have any questions regarding uncaptured authorization transactions, please refer to the Service Centre at 1-800-471-9511. Please use the USCardVerification transaction type if the intent is to simply verify the card. For a process flow, please refer to Process Flow for PreAuth / ReAuth / Capture Transactions.

%>

</BODY>
</HTML>
```

ReAuth

The ReAuth is virtually identical to the PreAuth with the exception of the transaction type. It is 'USReAuth' instead of 'USPreAuth'. Like the PreAuth example, ReAuth's require several variables (store_id, api_token, order_id, amount, orig_order_id, txn_number, and crypt). There are also optional fields, such as cust_id and dynamic_descriptor. Please refer to Appendix A. Definition of Request Fields for variable definitions.

Please note, a PreAuth may only be Captured once for less than, equal to, or greater than the original PreAuth amount. If the PreAuth is captured for less than its total amount, then a ReAuth is first required to be able to capture the remainder. The ReAuth references the original transaction by the orig_order_id and will only allow the merchant to re-authorise funds on the credit card used in the original transaction for no more than the upcaptured amount.

For a process flow, please refer to Process Flow for PreAuth / ReAuth / Capture Transactions.

Capture

The Capture transaction is used to secure the funds locked by a PreAuth or ReAuth transaction. When sending a 'USCompletion' request you will need two pieces of information from the original PreAuth – the order_id and the txn_number from the returned response. There are also two optional Level 2 variables (commcard_invoice and commcard_tax_amount) that may be submitted for Corporate Purchasing Cards.

A PreAuth or ReAuth transaction can only be captured ones. Please refer to the ReAuth transaction for more information on how to perform multiple Captures.

To reverse the full amount of the PreAuth, please use the Capture transaction with a dollar amount of "0.00". For a process flow, please refer to the Process Flow for PreAuth / ReAuth / Capture Transactions.

```

Void

The Void (USPurchaseCorrection) transaction is used to cancel a transaction that was performed in the current batch. No amount is required because a Void is always for 100% of the original transaction. The only transactions that can be Voided are Captures and Purchases. To send a 'USPurchaseCorrection' the order_id and txn_number from the 'USCompletion' or 'USPurchase' are required.

```

Independent Refund

The Independent Refund (USIndependentRefund) will credit a specified amount to the cardholder's credit card. The Independent Refund does not require an existing order to be logged in the eSELECTplus gateway; however, the credit card number and expiry date will need to be passed. The Independent Refund transaction requires several variables (store_id, api_token, order_id, amount, pan, expiry_date, and crypt). There are also optional fields, such as cust_id and dynamic_descriptor. The transaction format is almost identical to a Purchase or a PreAuth.

NOTE

The Independent Refund transaction may or may not be supported on your account. If you receive a transaction not allowed error when attempting an **independent refund**, it may mean the transaction is not supported on your account. If you wish to have the Independent Refund transaction type temporarily enabled (or re-enabled), please contact the Service Centre at 1-800-471-9511.

8. Basic Transactions with Extra Features - Examples

In the previous section the instructions were provided for the basic transaction set. eSELECTplus also provides several extra features/functionalities for the basic transactions. These features include storing customer and order details, Verified by Visa / SecureCode and sending transactions to the Recurring Billing feature. Verified by Visa / SecureCode and Recurring Billing must be added to your account, please call the Service Centre at 1-866-423-8475 to have your profile updated.

Purchase (with Customer and Order details)

Below is an example of sending a Purchase with the customer and order details. If one piece of information is sent then all fields must be included in the request. Unwanted fields need to be blank. Please see Appendix C. CustInfo Fields for description of each of the fields. The identical format is used for PreAuth with the exception of transaction type which changes from 'USPurchase' to 'USPreAuth' or 'USReAuth'. Customer details can only be sent with Purchase and PreAuth. It can be used in conjunction with other extra features such as VBV/MCSC and Recurring Billing. **Please note that the CustInfo fields are not used for any type of address verification or fraud check.**

```

    Response.Write "Timeout: " & out.getTimedoutStatus & "<br>"
    Response.Write "Ticket: " & out.getTicket & "<br>"
    Response.Write "CavvResultCode: " & out.getCavvResultCode & "<br>"

%>
</BODY>
</HTML>
```

As part of the VbV response there will be an additional response method of getCavvResultCode. Please refer to Appendix O. CAVV Result Code for a list of possible values.

Purchase (with Recurring Billing)

Recurring Billing is a feature that allows the transaction information to be sent once and then re-billed on a specified interval for a certain number of times. This is a feature commonly used for memberships, subscriptions, or any other charge that is re-billed on a regular basis. The transaction is split into two parts; the recur information and the transaction information. Please see Appendix D. Recur and Recur Update Fields for description of each of the fields. The optional customer and order details can be included in the transaction using the method outlined above - *Purchase (with Customer and Order Details)*. Recurring Billing must be added to your account, please call the Service Centre at 1-866-423-8475 to have your profile updated.

```
<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%

    store_id = "monusqa002"
    api_token = "qatoken"

    order_id = "recur-" & Day(Date) & Month(Date) & Year(Date) & "-" & Hour(Now) & Minute(Now) & Second(Now)
    amount="5.00"
    pan="4242424242424242"
    exp_date = "1111"
    cust_id = "cust_id"
    crypt_type="7"

    Response.Write "RecurSuccess: " & out.getRecurSuccess & "<br>"

%>
</BODY>
</HTML>
```

As part of the Recurring Billing response there will be an additional method called `getRecurSuccess()`. This can return a value of 'true' or 'false' based on whether the recurring transaction was successfully registered in our database.

Purchase (with CVD and AVS - eFraud)

Below is an example of a Purchase transaction with CVD and AVS information. These values can be sent in conjunction with other additional variables such as Recurring Billing or customer information. With this feature enabled in your merchant profile, you will be able to pass in these fields for the following transactions 'USPurchase', 'USPreAuth', 'USCavvPurchase', and 'USCavvPreAuth'. To form CvdInfo please refer to Appendix K. Card Validation Digits (CVD), to form AvsInfo please refer to Appendix L. Address Verification Service (AVS). To have the eFraud feature added to your profile, please call the Service Centre at 1-866-423-8475 to have your profile updated.

We strongly recommend that you include Address Verification (AVS) with all of your manually input transactions (MOTO/eCommerce). Doing so will ensure transactions are qualifying at the best possible interchange rate and will minimize costs to accept credit cards. If AVS is not present, the transaction may be assessed a higher interchange fee.

When testing eFraud (AVS and CVD) you **must only use** the Visa test card numbers, 4242424242424242 or 4005554444444403, and the amounts described in the Simulator eFraud Response Codes document available at <https://developer.moneris.com>

NOTE

The CVD Value supplied by the cardholder should simply be passed to the eSelectPlus payment gateway. Under no circumstances should it be stored for subsequent uses or displayed as part of the receipt information.

```

    Response.Write "CVD Result Code: " & out.getCvdResultCode & "<br>"
%>

</BODY>
</HTML>
```

As part of the eFraud response there will be two additional methods called `getAvsResultCode()` and `getCvdResultCode()`. For a list of possible CVD responses please refer to Appendix K. Card Validation Digits (CVD) and for a list of AVS responses, please refer to Appendix L. Address Verification Service (AVS).

Purchase (with Status Check)

The Status Check functionality may be used to verify whether a transaction processed successfully. If once a transaction is processed no response is received due to communication/technical difficulties, you may resend the transaction with the Status Check flag set to true. This will then initiate a lookup of the original transaction and eSelectPlus will verify whether it was processed or not. If the Status Check is set to false, the transaction will process as a net new transaction.

The Status Check flag is set to true or false at the request level as opposed to being at the transaction level. You should send the same parameter values for the transaction level fields in the Status Check request, i.e. if you send a Completion with Status Check, include the same values as the original Completion such as the Order ID, amount, Txn number, etc. What you will get back is a Status Code and Status Message in the Receipt as shown in the sample below. A Status Code of 0-49 indicates successful and 50-999 is not successful. The Status Message will be Found (Status Code of 0-49) or Not Found or null (Status Code of 50-999). When it is found, the other Response will also return the other parameters in the Receipt which will contain the response values for the original transaction allowing you to update your system and provide a receipt to the customer. When it is not found, these additional response values will be null.

Below is an example of a Purchase transaction with Status Check. The same parameter values for the original transaction should be sent in the Status Check request, i.e. if you send a purchase with Status Check, include the same values as the original Purchase such as the store_id, api_token, order_id, amount, pan, expdate, crypt_type and status_check. Please refer Appendix A. Definition of Request Fields for variable definitions.

Please note, Status Check is supported on the following transaction types:

Basic Transactions	VbV/SecureCode	Mag Swipe Transactions	ACH Transactions
UsPurchase UsRefund UsIndependentRefund UsPreauth UsCompletion UsPurchaseCorrection UsForcepost	UsCavvPurchase UsCavvPreauth	UsTrack2Purchase UsTrack2Refund UsTrack2IndependentRefund UsTrack2Preauth UsTrack2Completion UsTrack2PurchaseCorrection UsTrack2Forcepost	UsAchDebit UsAchReversal UsAchCredit

NOTE

The Status Check request should only be used once and immediately (within 2 minutes) after the last transaction that had failed.

The Status Check request should not be used to check USOpenTotals & USBatchClose requests.

Do not resend the Status Check request if it has timed out as additional investigation is required.

```
<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%
store_id = "monusqa002"
api_token = "gatoken"

</BODY>
</HTML>
```

As part of the Status Check response there will be two additional methods called `getStatusCode` and `getStatusMsg`. Please refer to Appendix B. Definitions of Response Fields for more a full description of each field.

9. Encrypted Transaction Examples

Included below is the sample code for the Encrypted transactions that can be found in the "Examples" folder of the COM API download. Encrypted Basic transactions allow the merchant to key in the credit card using a Moneris provided encrypted reader and submit the encrypted details. These transactions support the submission of the 'enc_track2' value only. Please note, these Encrypted Transactions are only applicable to card not present transactions requiring a credit card number. For the corresponding follow-on transactions such as Capture, Void and Refund please refer to the Basic Transaction Examples.

The encrypted MSR device may be used for processing swiped card present transactions, manually keyed card present transactions, as well as card not present transactions. This section refers only to the card not present transaction set. For card present encrypted transactions, please refer to the Encrypted Mag Swipe Transaction Examples.

Please note, the Encrypted Transactions may only be used with a Moneris provided encrypted mag swipe reader. To enquire about the encrypted MSR, please call the Service Centre at 1-866-423-8475.

Encrypted Purchase

Similar to the Basic Purchase example (USPurchase), in the Encrypted Purchase (USEncPurchase) example we require several variables (store_id, api_token, order_id, amount, enc_track2, crypt_type, and device_type). There are also a number of optional fields, such as cust_id, dynamic_descriptor, and two optional Level 2 variables (comcard_invoice and comcard_tax_amount) available for Corporate Purchasing Cards. Please refer to Appendix A. Definition of Request Fields for variable definitions.

```
<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%
    store_id = "monusqa002"
    api_token = "qatoken"
    order_id = "purch-" & Day(Date) & Month(Date) & Year(Date) & "-" & Hour(Now) & Minute(Now) & Second(Now)
    amount = "10.42"
    encTrack2 = ""
    device_type = "idtech"
    cust_id = "cust_id"
    crypt_type = "7"
    dynamic_descriptor = "12345"
    comcard_invoice = "Invoice 123456"
    comcard_tax_amount = "0.07"

    Set out = server.CreateObject("Moneris.USRequest")
    out.initRequest store_id, api_token, "https://esplusqa.moneris.com/gateway_us/servlet/MpgRequest"

    Set request1 = server.CreateObject("Moneris.USEncPurchase")
    request1.setCustId cust_id
    request1.setDynamicDescriptor dynamic_descriptor
    request1.setComcardInvoice comcard_invoice
    request1.setComcardTaxAmount comcard_tax_amount
    out.setRequest request1.formatRequest(order_id, amount, encTrack2, device_type, crypt_type)
    out.sendRequest

%>
<HTML>
<HEAD>
<META HTTP-EQUIV="Content-Type" Content="text-html; charset=Windows-1252">
</HEAD>
<BODY bgcolor=white>
<%
    Response.Write "Receipt ID: " & out.getReceiptID & "<br>"
    Response.Write "Response Code: " & out.getResponseCode & "<br>"
    Response.Write "Transaction Type: " & out.getTransType & "<br>"
    Response.Write "Message: " & out.getMessage & "<br>"
    Response.Write "Amount: " & out.getTransAmount & "<br>"
    Response.Write "Bank Totals: " & out.getBankTotals & "<br>"
    Response.Write "Card Type: " & out.getCardType & "<br>"
    Response.Write "Reference Number: " & out.getReferenceNum & "<br>"
    Response.Write "Transaction ID: " & out.getTransID & "<br>"
    Response.Write "ISO: " & out.getISO & "<br>"
    Response.Write "Auth Code: " & out.getAuthCode & "<br>"
    Response.Write "Transaction Time: " & out.getTransTime & "<br>"
    Response.Write "Transaction Date: " & out.getTransDate & "<br>"

    Response.Write "Ticket: " & out.getTicket & "<br>"
    Response.Write "dumpXML: " & out.dumpXMLResponse & "<br>"

%>
</BODY>
</HTML>
```

Encrypted PreAuth

The Encrypted PreAuth is virtually identical to the Encrypted Purchase with the exception of the transaction type. It is 'USEncPreauth' instead of 'USEncPurchase'. Like the Purchase example, the PreAuth requires several variables (store_id, api_token, order_id, amount, enc_track2, crypt_type, and device_type). There are also optional fields, such as cust_id and dynamic_descriptor. Please refer to Appendix A. Definition of Request Fields for variable definitions.

A PreAuth transaction **must** be reversed if it is not to be captured. To reverse an authorization, please refer to the Capture transaction in the Basic Transaction Examples. If you have any questions regarding uncaptured authorization transactions, please refer to the Service Centre at 1-800-471-9511. Please use the USEncCardVerification transaction type if the intent is to simply verify the card. For a process flow, please refer to Process Flow for PreAuth / ReAuth / Capture Transactions.

```

Response.Write "dumpXML: " & out.dumpXMLResponse & "<br>"
%>

</BODY>
</HTML>
```

Encrypted Independent Refund

The Encrypted Independent Refund (USEncIndRefund) will credit a specified amount to the cardholder's credit card. The Encrypted Independent Refund does not require an existing order to be logged in the eSELECTplus gateway; however, the credit card number and expiry date will need to be keyed in via the Moneris provided encrypted MSR device. The Independent Refund transaction requires several variables (store_id, api_token, order_id, amount, enc_track2, crypt_type and device_type). There are also optional fields, such as cust_id and dynamic_descriptor. The transaction format is almost identical to an Encrypted Purchase or PreAuth.

The Encrypted Independent Refund transaction may or may not be supported on your account. If you receive a transaction not allowed error when attempting an encrypted **independent refund**, it may mean the transaction is not supported on your account. If you wish to have the Independent Refund transaction type temporarily enabled (or re-enabled), please contact the Service Centre at 1-800-471-9511.

Encrypted Force Post

The Encrypted Force Post (USEncForcePost) transaction is used when a merchant obtains the authorization number directly from the issuer using a phone or any third party authorization method. The Force Post does not require an existing order to be logged in the eSELECTplus gateway; however, the credit card number, expiry date and the authorization number will need to be passed. This transaction allows the merchant to key the card number and expiry date via the Moneris provided Encrypted MSR device. There are also optional fields, such as cust_id and dynamic_descriptor.

10. Encrypted Transactions with Extra Features - Examples

In the previous section the instructions were provided for the card not present encrypted transaction set. eSELECTplus also provides several extra features/functionalities for the encrypted transactions. These features include storing customer and order details, verifying Card Verification Digits (CVD) and Address Verification (AVS) and sending transactions to the Recurring Billing feature. Recurring Billing must be added to your account, please call the Service Centre at 1-866-423-8475 to have your profile updated.

Encrypted Purchase (with Customer and Order details)

Below is an example of sending an Encrypted Purchase with the customer and order details. If one piece of information is sent then all fields must be included in the request. Unwanted fields need to be blank. Please see Appendix C. CustInfo Fields for description of each of the fields. The identical format is used for Encrypted PreAuth with the exception of transaction type which changes from 'USEncPurchase' to 'USEncPreauth'. Customer details can only be sent with Purchase and PreAuth. It can be used in conjunction with other extra features such as CVD/AVS and Recurring Billing. **Please note that the CustInfo fields are not used for any type of address verification or fraud check.**

```

Encrypted Purchase (with Recurring Billing)

Recurring Billing is a feature that allows the transaction information to be sent once and then re-billed on a specified interval for a certain number of times. This is a feature commonly used for memberships, subscriptions, or any other charge that is re-billed on a regular basis. The transaction is split into two parts; the recur information and the transaction information. Please see Appendix D. Recur and Recur Update Fields for description of each of the fields. The optional customer and order details can be included in the transaction using the method outlined above – *Encrypted Purchase (with Customer and Order Details)*.

Recurring Billing must be added to your account, please call the Service Centre at 1-866-423-8475 to have your profile updated.

%>
</BODY>
</HTML>
```

As part of the Recurring Billing response there will be an additional method called `getRecurSuccess`. This can return a value of 'true' or 'false' based on whether the recurring transaction was successfully registered in our database.

Encrypted Purchase (with CVD and AVS - eFraud)

Below is an example of a Encrypted Purchase transaction with CVD and AVS information. These values can be sent in conjunction with other additional variables such as Recurring Billing or customer information. With this feature enabled in your merchant profile, you will be able to pass in these fields for the following encrypted transactions: 'USEncPurchase', 'USEncPreauth'. To form CvdInfo please refer to Appendix K. Card Validation Digits (CVD), to form AvsInfo please refer to Appendix L. Address Verification Service (AVS). To have the eFraud feature added to your profile, please call the Service Centre at 1-866-423-8475 to have your profile updated.

We strongly recommend that you include Address Verification (AVS) with all of your manually input transactions (MOTO/eCommerce). Doing so will ensure transactions are qualifying at the best possible interchange rate and will minimize costs to accept credit cards. If AVS is not present, the transaction may be assessed a higher interchange fee.

When testing eFraud (AVS and CVD) you **must only use** the Visa test card numbers, 4242424242424242 or 4005554444444403, and the amounts described in the Simulator eFraud Response Codes document available at <https://developer.moneris.com>

The CVD Value supplied by the cardholder should simply be passed to the eSelectPlus payment gateway. Under no circumstances should it be stored for subsequent uses or displayed as part of the receipt information.

11. Mag Swipe Transaction Examples

Included below is the sample code for the Mag Swipe transactions that can be found in the "Examples" folder of the COM API download. Mag Swipe transactions allow the user to swipe their credit card and submit the Track2 details. These transactions support the submission of 'track2', as well as a manual entry of the credit card number and expiry date using the 'pan' and 'expiry_date' variables. If all three fields are submitted, the track2 details will be used to process the transaction.

Mag Swipe Purchase

Similar to the basic Purchase, in the Mag Swipe Purchase (USTRack2Purchase) example we require several variables (store_id, api_token, order_id, amount, track2 and/or pan, expiry_date, and pos_code). There are also a number of optional fields, such as cust_id, dynamic_descriptor, and two optional Level 2 variables (commcard_invoice and commcard_tax_amount) available for Corporate Purchasing Cards. Please refer to Appendix A. Definition of Request Fields for variable definitions.

```
<HTML>
<HEAD>
<META HTTP-EQUIV="Content-Type" Content="text-html; charset=Windows-1252">
</HEAD>
<BODY bgcolor=white>

<script type="text/javascript">

var track

if ((location.href).indexOf("?") == -1)
{
    var track1 = prompt("Please swipe your card", "Please Swipe")

    if (track1.indexOf(";") == 0)
    {
        track = track1
    }
    else
    {
        var track2 = prompt("Please swipe your card again", "Please Swipe to get track2")
        track = track2
    }
    document.write("Track2 = " + track)
}

function setTrack2 (form)
{
    form.track2.value=track
}

</script>

<form name="paymentForm" method="get">
    Is this track2 correct? <input type="checkbox" onClick="setTrack2(this.form)"/><br/>
    <input type="hidden" name="track2" value=""/>
    <input type="submit" value="Submit" />
</form>

<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%
    store_id = "monusqa002"
    api_token = "qatoken"

    order_id = "t2purch-"&Day(Date)&Month(Date)&Year(Date)&"-"&Hour(Now)&Minute(Now)&Second(Now)
    amount="5.00"
    track2=";4924190000004030=09121214797536211133?"
    pos_code="00"
    pan=""
    exp_date = ""
```

```
'=====
'Set optional Customer ID & Level 2 details
cust_id = "cust_id"
commcard_invoice = "Invoice 5757FRJ8"
commcard_tax_amount = "0.15"

Set out = server.CreateObject("Moneris.USRequest")
out.initRequest store_id, api_token, "https://esplusqa.moneris.com/gateway_us/servlet/MpgRequest"

Set track2purchaserequest = server.CreateObject("Moneris.USTrack2Purchase")
    track2purchaserequest.setCustId cust_id

Mag Swipe Capture

The Mag Swipe Capture (USTRack2Completion) transaction is used to secure the funds locked by a 'USTRack2PreAuth' transaction. When sending a 'USTRack2Completion' request you will need two pieces of information from the original 'USTRack2PreAuth' – the order_id and the txn_number from the returned response; it does not require the customer to re-swipe the credit card. There are also two optional Level 2 variables (commcard_invoice and commcard_tax_amount) that may be submitted for Corporate Purchasing Cards.

```
<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%
    store_id = "monusqa002"
    api_token = "qatoken"

    Response.Write "Ticket: " & out.getTicket & "<br>"
%>

</BODY>
</HTML>
```

Mag Swipe Void

The Mag Swipe Void (USTRack2PurchaseCorrection) transaction is used to cancel a transaction that was performed in the current batch. No amount is required because a Void is always for 100% of the original transaction. The only transactions that can be Voided are Captures and Purchases. To send a 'USTRack2PurchaseCorrection' the order_id and txn_number from the 'USTRack2Completion' or 'USTRack2Purchase' are required; it does not require the customer to re-swipe the credit card.

```

Mag Swipe Refund

The Mag Swipe Refund (USTRack2Refund) will credit a specified amount to the cardholder's credit card. A Refund can be sent up to the full value of the original Capture or Purchase. To send a 'USTRack2Refund' you will require the order_id and txn_number from the original 'USTRack2Completion' or 'USTRack2Purchase'; it does not require the customer to re-swipe the credit card.

```

Mag Swipe Independent Refund

The Mag Swipe Independent Refund (USTRack2IndependentRefund) will credit a specified amount to the cardholder's credit card. The Mag Swipe Independent Refund does not require an existing order to be logged in the eSELECTplus gateway; however, the credit card will need to be swiped to provide the track2. There are also optional fields that may be submitted, such as cust_id and dynamic_descriptor. The transaction format is almost identical to a Mag Swipe Purchase or a Mag Swipe PreAuth.

NOTE

The Mag Swipe Independent Refund transaction may or may not be supported on your account. If you receive a transaction not allowed error when attempting a mag swipe **independent refund**, it may mean the transaction is not supported on your account. If you wish to have the Independent Refund transaction type temporarily enabled (or re-enabled), please contact the Service Centre at 1-800-471-9511.

Mag Swipe Forcepost

The Mag Swipe Force Post (USTRack2ForcePost) is used when a merchant obtains the authorization number directly from the issuer using a phone or any third party authorization method. The Mag Swipe Force Post does not require an existing order to be logged in the eSELECTplus gateway; however, the credit card will need to be swiped to provide the track2 data. There are also optional fields that may be submitted, such as cust_id and dynamic_descriptor. To complete the transaction, the authorization number obtained from the issuer must also be entered.

12. Mag Swipe Transactions with Extra Features - Examples

In the previous section the instructions were provided for the Mag Swipe transaction set. eSELECTplus also provides the ability to perform an Address Verification Service check with a Mag Swipe transaction.

Mag Swipe Purchase (with Address Verification Service – AVS)

Below is an example of a Mag Swipe Purchase transaction with AVS information. With this feature enabled in your merchant profile, you will be able to pass in these fields for both 'USTRack2Purchase' and 'USTRack2PreAuth' transactions. To form AvsInfo please refer to Appendix N. Card Level Result Value. To have the eFraud feature added to your profile, please call the Service Centre at 1-866-423-8475 to have your profile updated.

We strongly recommend that you include Address Verification (AVS) with all of your manually input transactions (MOTO/eCommerce). Doing so will ensure transactions are qualifying at the best possible interchange rate and will minimize costs to accept credit cards. If AVS is not present, the transaction may be assessed a higher interchange fee.

When testing AVS (eFraud) you **must only use** the Visa test card numbers, 4242424242424242 or 4005554444444403, and the amounts described in the Simulator eFraud Response Codes document available at <https://developer.moneris.com>

```

    Response.Write "Transaction ID: " & out.getTransID & "<br>"
    Response.Write "ISO: " & out.getISO & "<br>"
    Response.Write "Auth Code: " & out.getAuthCode & "<br>"
    Response.Write "Transaction Time: " & out.getTransTime & "<br>"
    Response.Write "Transaction Date: " & out.getTransDate & "<br>"
    Response.Write "Complete: " & out.getCompleteStatus & "<br>"
    Response.Write "Timeout: " & out.getTimedoutStatus & "<br>"
    Response.Write "Ticket: " & out.getTicket & "<br>"
    Response.Write "Avs Result: " & out.getAvsResultCode & "<br>"
    Response.Write "Cvd Result: " & out.getCvdResultCode & "<br>"
%>

</BODY>
</HTML>

```

As part of the AVS (eFraud) response there will be an additional method called `getAvsResultCode()`. For a list of possible AVS responses, please refer to Appendix N. Card Level Result Value

**NOTE**

Please note, the above transaction with AVS information may not be tested within our current test environment because the test Visa card numbers can not be swiped. To receive an AVS response you may pass the test Visa card number as the 'pan'.

13. Encrypted Mag Swipe Transaction Examples

Included below is the sample code for the Encrypted Mag Swipe transactions that can be found in the "Examples" folder of the Java API download. Encrypted Mag Swipe transactions allow the user to swipe or key in their credit card using a Moneris provided encrypted mag swipe reader and submit the encrypted Track2 details. These transactions support the submission of the 'enc_track2' value only. Please note, the Encrypted Mag Swipe Transactions are only applicable to card present transactions requiring a credit card number. For card present follow-on transactions such as Capture, Void and Refund please refer to the Mag Swipe Transaction Examples.

The encrypted MSR device may be used for processing swiped card present transactions, manually keyed card present transactions, as well as card not present transactions. This section refers only to the swiped and manually keyed card present transaction set. For card not present encrypted transactions, please refer to the Encrypted Transaction Examples.

Please note, the Encrypted Mag Swipe Transactions may only be used with a Moneris provided encrypted mag swipe reader. To enquire about the encrypted MSR, please call the Service Centre at 1-866-423-8475.

Encrypted Mag Swipe Purchase

Similar to the Mag Swipe Purchase (USTRack2Purchase), in the Encrypted Mag Swipe Purchase (UENcTrack2Purchase) example we require several variables (store_id, api_token, order_id, amount, enc_track2, pos_code, and device_type). There are also a number of optional fields, such as cust_id, dynamic_descriptor, and two optional Level 2 variables (commcard_invoice and commcard_tax_amount) available for Corporate Purchasing Cards. Please refer to Appendix A. Definition of Request Fields for variable definitions.

```

Encrypted Mag Swipe Independent Refund

The Encrypted Mag Swipe Independent Refund (USEncTrack2IndependentRefund) will credit a specified amount to the cardholder's credit card. The Encrypted Mag Swipe Independent Refund does not require an existing order to be logged in the eSELECTplus gateway; however, the credit card will need to be swiped using the Moneris provided encrypted mag swipe reader to provide the encrypted track2 details. There are also optional fields that may be submitted, such as `cust_id` and `dynamic_descriptor`. The transaction format is almost identical to an Encrypted Mag Swipe Purchase or an Encrypted Mag Swipe PreAuth.

NOTE

The Encrypted Mag Swipe Independent Refund transaction may or may not be supported on your account. If you receive a transaction not allowed error when attempting a mag swipe **independent refund**, it may mean the transaction is not supported on your account. If you wish to have the Independent Refund transaction type temporarily enabled (or re-enabled), please contact the Service Centre at 1-800-471-9511.

Encrypted Mag Swipe Forcepost

The Encrypted Mag Swipe Force Post (USEncTrack2Forcepost) is used when a merchant obtains the authorization number directly from the issuer using a phone or any third party authorization method. The Encrypted Mag Swipe Force Post does not require an existing order to be logged in the eSELECTplus gateway; however, the credit card will need to be swiped or keyed in using a Moneris provided encrypted mag swipe reader and submit the encrypted Track2 details. There are also optional fields that may be submitted, such as cust_id and dynamic_descriptor. To complete the transaction, the authorization number obtained from the issuer must also be entered.

14. Encrypted Mag Swipe Transactions with Extra Features - Examples

In the previous section the instructions were provided for the Encrypted Mag Swipe transaction set. eSELECTplus also provides the ability to perform an Address Verification Service check with an Encrypted Mag Swipe transaction.

Encrypted Mag Swipe Purchase (with Address Verification Service – AVS)

Below is an example of an Encrypted Mag Swipe Purchase transaction with AVS information. With this feature enabled in your merchant profile, you will be able to pass in these fields for both 'UsEncTrack2Purchase' and 'UsEncTrack2Preauth' transactions. To form avs_info please refer to Appendix L. Address Verification Service (AVS). To have the eFraud feature added to your profile, please call the Service Centre at 1-866-423-8475 to have your profile updated.

When testing AVS (eFraud) you **must only use** the Visa test card numbers, 4242424242424242 or 4005554444444403, and the amounts described in the Simulator eFraud Response Codes document available at <https://developer.moneris.com>

```

Response.Write "AVS Result Code: " & out.getAvsResultCode & "<br>"
Response.Write "dumpXML: " & out.dumpXMLResponse & "<br>"
%>
</BODY>
</HTML>
```

Please note, the above transaction with AVS information may not be tested within our current test environment because the test Visa card numbers can not be swiped. To receive an AVS response you may pass the test Visa card number as the 'pan'.

15. Pinless Debit Transaction Examples

Included below is the sample code for the Pinless Debit transactions that can be found in the "Examples" folder of the COM API download. Pinless Debit transactions allow the user to submit billing invoice account information and have funds debited from their bank account for bill payment. This transaction type lets the merchant know if the funds are available or not.

Pinless Debit Purchase

In the Pinless Debit Purchase (USPinlessDebitPurchase) example we require several mandatory variables: store_id, api_token, order_id, amount, pan, presentation_type, intended_use and p_account_number. There are also many optional variables, such as the expiry_date, cust_id. Please refer to Appendix A. Definition of Request Fields and Appendix E. Pinless Debit Fields for variable definitions.

```
<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%

%>

</BODY>
</HTML>
```

Pinless Debit Refund

The Pinless Debit Refund (USPinlessDebitRefund) transaction is used to refund a prior Pinless Debit Purchase transaction that was performed within the past 3 months. No amount is required because a Pinless Debit Refund is always for 100% of the original transaction. To send a 'USPinlessDebitRefund' the order_id and txn_number from the 'USPinlessDebitPurchase' are required; it does not require the Pinless Debit information to be re-entered.

```

17. ACH Transaction Examples

Included below is the sample code for the ACH transactions that can be found in the "Examples" folder of the COM API download. ACH transactions allow the user to submit bank account information to have funds either debited or credited.

ACH Debit

In the ACH Debit (USACHDebit) example we require several mandatory variables: store_id, api_token, order_id, amount, sec, routing_num, account_num, and account_type. There are also many optional variables, such as the cust_id, check_num and the customer details. Please refer to Appendix A. Definition of Request Fields for all request variables and Appendix F. AchInfo Fields for all ACH variables. **Please note that the AchInfo fields are not used for any type of address verification or fraud check.**

ACH Debit (Check not present)

SEC codes for physical check **not present** include: 'web', 'ccd', 'ppd'. In the example below the following variables are required for an ACH Debit (check not present) transaction: routing_num, account_num, check_num and account_type. Please refer to Appendix G. ACH Sec Codes and Process Flow for a full description on the mandatory fields.

```
<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%
    store_id = "monusqa024"
    api_token = "qatoken"

    order_id = "achDebit-" & Day(Date) & Month(Date) & Year(Date) & "-" & Hour(Now) & Minute(Now) & Second(Now)
    amount="5.00"

    '====ACH Info=====
    sec="ppd"
    cust_first_name="Joe"
    cust_last_name="Jones"
    cust_address1="123 Main St."
    cust_address2=""
    cust_city="Destine"
    cust_state="TX"
    cust_zip="32542"

ACH Credit

In the ACH Credit (USACHCredit) example we require several mandatory variables: store_id, api_token, order_id, amount, sec, routing_num, account_num, and account_type. There are also many optional variables, such as the cust_id, check_num and the customer details. Please refer to Appendix A. Definition of Request Fields and Appendix F. AchInfo Fields for variable definitions. **Please note that the AchInfo fields are not used for any type of address verification or fraud check.**

NOTE

Please note, the ACH Credit transaction may only be submitted with a SEC Code of 'ppd' or 'ccd'.

ACH Reversal

The ACH Reversal (USAchReversal) transaction is used to reverse a prior ACH Debit transaction that was performed within the past 3 months. No amount is required because a Reversal is always for 100% of the original transaction. To send a 'USAchReversal' the order_id and txn_number from the 'USAchDebit' are required; it does not require the bank account information to be re-entered.

ACH FI Enquiry

The ACH FI Enquiry (USAchFiEnquiry) transaction allows the merchant to submit a routing number and verify which Financial Institution it belongs to. This transaction also allows the merchant to verify whether or not this is a valid routing number before submitting an ACH Debit or Credit transaction.

18. ACH Transactions with Extra Features – Examples

In the previous section the instructions were provided for the ACH transaction set. eSELECTplus also provides several extra features/functionalities for the ACH transactions. These features include storing customer and order details and sending transactions to the Recurring Billing feature. Recurring Billing must be added to your account, please call the Service Centre at 1-866-423-8475 to have your profile updated.

ACH Debit (with Customer and Order details)

Below is an example of sending an ACH Debit (USAchDebit) with the customer and order details. If one piece of information is sent then all fields must be included in the request. Unwanted fields need to be blank. Please see Appendix C. CustInfo Fields for description of each of the fields. Customer details can only be sent with the ACH Debit transaction. It can be used in conjunction with other extra features such as Recurring Billing. ***Please note that the CustInfo fields are not used for any type of address verification or fraud check.***

ACH Debit (with Recurring Billing)

Recurring Billing is a feature that allows the transaction information to be sent once and then re-billed on a specified interval for a certain number of times. This is a feature commonly used for memberships, subscriptions, or any other charge that is re-billed on a regular basis. The transaction is split into two parts; the recur information and the transaction information. Please see Appendix D. Recur and Recur Update Fields for description of each of the Recur fields. The optional customer and order details can be included in the transaction using the method outlined above – *ACH Debit (with Customer and Order Details)*. Recurring Billing must be added to your account, please call the Service Centre at 1-866-423-8475 to have your profile updated. **Please note that the Recurring Billing fields are only available to SEC codes 'ppd' 'ccd' and 'web'.**

19. Administrative Transactions

Included below is the sample code for the Administrative transactions that can be found in the “Examples” folder of the COM API download. Administrative transactions allow the user to perform such tasks as manually closing an open Batch and preparing the funds for settlement. Also, the user may retrieve details about the currently open Batch without needing to close it.

Batch Close

At the end of every financial day (11pm EST) the Batch needs to be closed in order to have the Credit Card funds settled the next business day and the ACH funds settled, on average, within the next 5 business days. *By default eSELECTplus will automatically close your Batch daily, whenever there are funds in the open Batch.* Some merchants prefer to control Batch Close, and disable the automatic functionality. For these merchants we have provided the ability to close your Batch through the API. When a Batch is closed the response will include the transaction count and amount for each type of transaction. To disable automatic close please access the Merchant Resource Centre (<https://esplus.moneris.com/usmpg>), go to the Admin menu item and then choose Store Settings; the Batch Close options are located on this page.

```
<% @Language = "VBScript" %>
<% Response.buffer = true %>
<%
    store_id = "monusqa002"
    api_token = "qatoken"

    ecr_number="64000003"

    Set out = server.CreateObject("Moneris.USRequest")
    out.initRequest store_id, api_token, "https://esplusqa.moneris.com/gateway_us/servlet/MpgRequest"

    Set batchClose = server.CreateObject("Moneris.USBatchClose")

    out.setRequest batchClose.formatRequest(ecr_number)
    out.sendRequest
%>

<HTML>
<HEAD>
<META HTTP-EQUIV="Content-Type" Content="text-html; charset=Windows-1252">
</HEAD>
<BODY bgcolor=white>

<%
    Response.Write "Receipt ID: " & out.getReceiptID & "<br>"
    Response.Write "Response Code: " & out.getResponseCode & "<br>"

Card Verification

The Card Verification (USCardVerification) transaction is available to check the validity of a credit card, expiry date and any additional details, such as the Card Verification Digits or Address Verification details. It does not verify the available amount or lock any funds on the credit card. The CardVerification transaction requires several variables (store_id, api_token, order_id, pan, expiry_date). Also, Address Verification (AVS) is required while the Card Verification Digits (CVD) are optional. This transaction type will not place a charge on the credit card. Please refer to Appendix A. Definition of Request Fields for variable definitions.

Encrypted Card Verification

Similar to the regular Card Verification transaction mentioned above, the Encrypted Card Verification (USEncCardVerification) transaction is available to check the validity of a credit card, expiry date and any additional details, such as the Card Verification Digits or Address Verification details. It does not verify the available amount or lock any funds on the credit card. The Encrypted Card Verification requires the card data to be keyed in via the Moneris provided encrypted MSR device. This transaction requires several variables (store_id, api_token, order_id, enc_track2 and device_type). Also, Address Verification (AVS) is required while the Card Verification Digits (CVD) are optional. This transaction type will not place a charge on the credit card. Please refer to Appendix A. Definition of Request Fields for variable definitions

Recur Update

Recur Update allows a user to alter characteristics of a previously registered Recurring Billing transaction. This feature is commonly used to update a customer's credit card information and the number of times it is to be billed (recur). Only fields sent to the gateway will be updated. Please see Appendix A. Definition of Request Fields and Appendix D. Recur and Recur Update Fields for description of each of the fields.

20. What Information will I get as a Response to My Transaction Request?

For each transaction you will receive a response message. For a full description of each field please refer to Appendix B. Definitions of Response Fields.

To determine whether a transaction is successful or not the field that must be checked is ResponseCode. See the table below to determine the transaction result.

Response Code	Result
0 – 49 (inclusive)	Approved
50 – 999 (inclusive)	Declined
Null	Incomplete

For a full list of response codes and the associated message please refer to the Response Code document available at <https://developer.moneris.com>

21. How Do I Test My Solution?

A testing environment is available for you to connect to while you are integrating your site to our payment gateway. The test environment is generally available 7x24; however since it is a test environment we cannot guarantee 100% availability. Also, please be aware that other merchants are using the test environment so you may see transactions and user IDs that you did not create. As a courtesy to others that are testing we ask that when you are processing Refunds, changing passwords and/or trying other functions that you use only the transactions/users that you created.

When using the APIs in the test environment you will need to use test store_id and api_token. These are different than your production IDs. The IDs that you can use in the test environment are in the table below.

Test IDs			
store_id	api_token	Username	Password
monusqa002***	qatoken	demouser	abc1234
monusqa003	qatoken	demouser	abc1234
monusqa004	qatoken	demouser	abc1234
monusqa005	qatoken	demouser	abc1234
monusqa006	qatoken	demouser	abc1234
monusqa024 *	qatoken	demouser	abc1234
monusqa025 **	qatoken	demouser	abc1234

* test store 'monusqa024' is intended for testing ACH transactions only

** test store 'monusqa025' is intended for testing both ACH and Credit Card transactions

*** test store 'monusqa002' is intended for testing the Pinless Debit transactions

When testing you may use the following test card numbers with any future expiry date.

Test Card Numbers	
Card Plan	Card Number
MasterCard	5454545454545454
Visa	4242424242424242 or 4005554444444403
Amex	373599005095005
Pinless Debit	4496270000164824

When testing ACH transactions you may use the following test bank account details.

Test Bank Account Details			
Financial Institution	Routing Number	Account Number	Check Number
FEDERAL RESERVE BANK	011000015	Any number between 5-22 digits	Any number

To access the Merchant Resource Centre in the test environment go to <https://esplusqa.moneris.com/usmpg>. And use the logins provided in the previous table.

The test environment has been designed to replicate our production environment as closely as possible. One major difference is that we are unable to send test transactions onto the production authorization network and thus Issuer responses are simulated. Additionally, the requirement to emulate approval, decline and error situations dictates that we use certain transaction variables to initiate various response and error situations.

The test environment will approve and decline credit card transactions based on the penny value of the amount field.

For example, a credit card transaction made for the amount of \$9.00 or \$1.00 will approve since the .00 penny value is set to approve in the test environment. Transactions in the test environment should not exceed \$11.00. This limit does not exist in the production environment. For a list of all current test environment responses for various penny values, please see the Test Environment Penny Response table as well as the Test Environment eFraud Response table, available at <https://developer.moneris.com>

NOTE

These responses may change without notice. Moneris Solutions recommends you regularly refer to our website to check for possible changes.

The test environment will approve/register all ACH transactions as long as there is no error with the format.

For example, if all of the ACH variables are properly named and populated, all transactions will approve/register. If there is a format violation, such as invalid data in one of the fields (ex. cust_zip requires 'MI' but 'Michigan' is sent) then the ACH transaction will decline/fail to register.

22. What Do I Need to Include in the Receipt?

Visa and MasterCard expect certain variables be returned to the cardholder and presented as a receipt when a transaction is approved. These fields vary depending on what type of transaction was performed:

- Basic Transaction (Non Track2 / Card Not Present) – please refer to Appendix P. Basic Transaction Receipt (Non Track2)
- Mag Swipe Transaction (Track2 / Card Present) – please refer to Appendix Q. Mag Swipe Transaction Receipt (Track2)

In addition, for non credit card transactions, such as Pinless Debit and ACH, there are certain fields that are recommended to be returned in a receipt of registration of the transaction.

- Pinless Debit – please refer to Appendix R. Pinless Debit Transaction Receipt
- ACH Transaction (Check not present) – please refer to Appendix S. ACH Transaction Receipt (Check Not Present)

For a breakdown of all required fields, as well as a sample of the receipt, please refer to the appropriate Appendix listed above.

23. How Do I Activate My Store?

Once you have received your activation letter/fax go to <https://esplus.moneris.com/usmpg/activate/> as instructed in the letter/fax. You will need to input your store ID and merchant ID then click on 'Activate'. In this process you will need to create an administrator account that you will use to log into the Merchant Resource Centre to access and administer your eSELECTplus store. You will need to use the Store ID and API Token to send transactions through the API.

Once you have created your first Merchant Resource Centre user, please log on to the Interface by clicking the "eSELECTplus" button. Once you have logged in please proceed to ADMIN and then STORE SETTINGS. At the top of the page you will locate your production API Token.

24. How Do I Configure My Store For Production?

Once you have completed your testing you are ready to point your store to the production host. You will need to change the "host" to be esplus.moneris.com. You will also need to change the store_id to reflect your production store ID and well the api_token must be changed to your production token to reflect the token that you received during activation.

Once you are in production you will access the Merchant Resource Centre at <https://esplus.moneris.com/usmpg>. You can use the store administrator ID you created during the activation process and then create additional users as needed.

For further information on how to use the Merchant Resource Centre please see the HELP button found in the top left corner of the website.

25. How Do I Get Help?

If you require assistance while integrating your store, please contact the Support Team:

For financial support:
Phone: 1-800-471-9511
Email: supportinfo@moneris.com

For technical and integration support:
Phone: 1-866-696-0488
Email: eselectplus@moneris.com

When sending an email support request please be sure to include your name and phone number, a clear description of the problem as well as the type of API that you are using. **For security reasons, please do not send us your API Token combined with your store ID, or your merchant number and device number in the same email.**

26. Appendix A. Definition of Request Fields

Request Fields		
Variable Name	Size/Type	Description
order_id	50 / an	Merchant defined unique transaction identifier - must be unique for every Purchase, PreAuth and Independent Refund attempt. For Refunds, Completions and Voids the order_id must reference the original transaction. Characters allowed for Order ID: a-z A-Z 0-9 _ - : . @ spaces
pan	20 / variable	Credit Card Number - no spaces or dashes. Most credit card numbers today are 16 digits in length but some 13 digits are still accepted by some issuers. This field has been intentionally expanded to 20 digits in consideration for future expansion and/or potential support of private label card ranges.
expiry_date	4 / num	Expiry Date - format YYMM no spaces or slashes. PLEASE NOTE THAT THIS IS REVERSED FROM THE DATE DISPLAYED ON THE PHYSICAL CARD WHICH IS MMY *'expiry_date' is optional for Pinless Debit Purchase
amount	9 / decimal	Amount of the transaction. This must contain 3 digits with two penny values. The minimum value passed can be 0.01 and the maximum 9999999.99
crypt	1 / an	E-Commerce Indicator: 1 - Mail Order / Telephone Order - Single 2 - Mail Order / Telephone Order - Recurring 3 - Mail Order / Telephone Order - Instalment 4 - Mail Order / Telephone Order - Unknown Classification 5 - Authenticated E-commerce Transaction (VBV/MCSC) 6 - Non Authenticated E-commerce Transaction (VBV/MCSC) 7 - SSL enabled merchant 8 - Non Secure Transaction (Web or Email Based) 9 - SET non - Authenticated transaction
pos_code	2 / num	Under normal presentment situations the value should be '00'. In the case of a PreAuth/Completion, if the PreAuth was card present keyed-in then the 'pos_code' for the completion should be '71' (meaning that a 'USTRack2Preauth' transaction was submitted where the 'pan' and 'expiry_date' variables were populated while the 'track2' was left blank). In an unmanned kiosk environment, where the card is present, the value should be '27'. If the solution is not "merchant and cardholder present" please call the support desk and we will provide the proper POS Code.
txn_number	255 / varchar	Used when performing follow on transactions - this must be filled with the value that was returned as the Txn_number in the response of the original transaction. When performing a Capture this must reference the PreAuth. When performing a Refund or a Void this must reference the Capture or the Purchase.
cust_id	50/an	This is an optional field that can be sent as part of a Purchase or PreAuth request. It is searchable from the Moneris Merchant Resource Centre. It is commonly used for policy number, membership number, student ID or invoice number.
track2		This is a string that is retrieved from the mag swipe of a credit card by swiping the credit card through a card reader. It is part of a mag swipe/track2 transaction.

enc_track2		This is a string that is retrieved by swiping or keying in a credit card through a Moneris provided encrypted mag swipe card reader. It is part of an encrypted keyed or swiped transaction only. This string must be retrieved by a specific device. Please refer to device_type for the list of current available devices.
device_type	an	Defines the encrypted mag swipe reader that was used for swiping the credit card. Please note, this device must be provided by Moneris Solutions so that the values are properly encrypted and decrypted. This field is case sensitive. Available values are: device_type="idtech"
cavv		This is a value that is provided by the Moneris MPI or by a third party MPI. It is part of a VBV/MCSC transaction.
avs_street_number	19 / an	Street Number & Street Name (max – 19 digit limit for street number and street name combined). This must match the address that the issuing bank has on file.
avs_street_name		
avs_zipcode	9 / an	Zip or Postal Code – This must match what the issuing banks has on file.
cvd_value	4 / num	Credit Card CVD value – this number accommodates either 3 or 4 digit CVD values. Refer to Appendix K. Card Validation Digits (CVD) for further details. Note: The CVD value supplied by the cardholder should simply be passed to the eSELECTplus payment gateway. Under no circumstances should it be stored for subsequent uses or displayed as part of the receipt information.
cvd_indicator	1 / num	CVD presence indicator (1 digit – refer to Appendix K. Card Validation Digits (CVD) for values)
commcard_invoice	17 / an	Level 2 Invoice Number for the transaction. Used for Corporate Credit Card transactions (Commercial Purchasing Cards). Characters allowed for commcard_invoice: a-z A-Z 0-9 spaces
commcard_tax_amount	9 / decimal	Level 2 Tax Amount of the transaction. Used for Corporate Credit Card transactions (Commercial Purchasing Cards). This must contain 3 digits with two penny values. The minimum value passed can be 0.00 and the maximum is 9999999.99
orig_order_id	50 / an	Merchant defined transaction identifier – used in the ReAuth transaction to refer to the original PreAuth that has been partially captured.
dynamic_descriptor	25 / an	Merchant defined description sent on a per-transaction basis that will appear on the credit card statement appended to the merchant's business name. Please note, the combined length of the merchant's business name and dynamic_descriptor may not exceed 25 characters.
status_check	true/false	Once set to "true" the gateway will check the status of a transaction that has an order_id that matches the one passed. <ul style="list-style-type: none"> ▪ If the transaction is found the gateway will respond with the specifics of that transaction (Check Appendix B. Definitions of Response Fields) ▪ If the transaction is not found then the gateway will respond with a not found message (Check Appendix B. Definitions of Response Fields) Once it is set to "false" the transaction will process as a new transaction

**NOTE**

The order_id allows the following characters: **a-z A-Z 0-9 _ - : . @ spaces**

The commcard_invoice allows the following characters: **a-z A-Z 0-9 spaces**

All other request fields allow the following characters: **a-z A-Z 0-9 _ - : . @ \$ = /**

27. Appendix B. Definitions of Response Fields

Response Fields		
Variable Name	Size/Type	Description
ReceiptId	50 / an	order_id specified in request
ReferenceNum	18 / num	The reference number is an 18 character string that references the terminal used to process the transaction as well as the shift, batch and sequence number. This data is typically used to reference transactions on the host systems and must be displayed on any receipt presented to the customer. This information should be stored by the merchant. The following illustrates the breakdown of this field where "640123450010690030" is the reference number returned in the message, "64012345" is the terminal id, "001" is the shift number, "069" is the batch number and "003" is the transaction number within the batch. Moneris Host Transaction identifier.
ReponseCode	3 / num	Transaction Response Code < 50: Transaction approved >= 50: Transaction declined NULL: Transaction was not sent for authorization * If you would like further details on the response codes that are returned please see the Response Codes document available at https://developer.moneris.com
AuthCode	8 / an	Authorization code returned from the issuing institution
TransTime	##:##:##	Processing host time stamp
TransDate	yyyy-mm-dd	Processing host date stamp
TransType	an	Type of transaction that was performed
Complete	true/false	Transaction was sent to authorization host and a response was received
Message	100 / an	Response description returned from issuing institution.
TransAmount		
CardType	2 / alpha	Credit Card Type
Txn_number	20 / an	Gateway Transaction identifier
TimedOut	true/false	Transaction failed due to a process timing out
Ticket	n/a	reserved
MaskedPan	####*##### ####*#####	Indicates the first 4 last 4 digits of the credit card number that was swiped or keyed in using the encrypted mag swipe reader so that it may be displayed on a receipt.
RecurSucess	true/false	Indicates whether the transaction successfully registered.
AvsResultCode	1/alpha	Indicates the address verification result. Refer to Appendix L. Address Verification Service (AVS).
CvdResultCode	2/an	Indicates the CVD validation result. Refer to Appendix K. Card Validation Digits (CVD).
RecurUpdateSuccess	true/false	Indicates whether the transaction successfully updated.
NextRecurDate	yyyy-mm-dd	Indicates when the transaction will be billed again (recur).
RecurEndDate	yyyy-mm-dd	Indicates when the Recurring Billing Transaction will end.
CardLevelResult	3/an	Please refer to Appendix N. Card Level Result Value for a list of all Visa and MasterCard Card Level Result values.

CavvResultCode	1 / an	<p>The CAVV result code indicates the result of the CAVV validation. Note this is only applicable to Visa VBV transactions.</p> <p>0 = CAVV authentication results invalid</p> <p>1 = CAVV failed validation; authentication</p> <p>2 = CAVV passed validation; authentication</p> <p>3 = CAVV passed validation; attempt</p> <p>4 = CAVV failed validation; attempt</p> <p>7 = CAVV failed validation; attempt (US issued cards only)</p> <p>8 = CAVV passed validation; attempt (US issued cards only)</p> <p>9 = CAVV failed validation; attempt (US issued cards only)</p> <p>A = CAVV passed validation; attempt (US issued cards only)</p> <p>B = CAVV passed validation; information only, no liability shift</p> <p>Please refer to Appendix O. CAVV Result Code for a description for each response.</p>
StatusCode	3/an	<p>The StatusCode is populated when status_check is set to "true" in the request</p> <p>< 50: Transaction found</p> <p>>= 50: Transaction not found</p>
StatusMsg	found/not found	<p>The StatusMsg is populated when status_check is set to "true" in the request</p>

28. Appendix C. CustInfo Fields

Field Definitions		
Field Name	Size/Type	Description

Billing and Shipping Information

NOTE: The fields for billing and shipping information are identical. Please refer to section 8 - Purchase (with Customer and Order details) for an example.

first_name	30 / an
last_name	30 / an
company_name	30 / an
address	30 / an
city	30 / an
province	30 / an
postal_code	30 / an
country	30 / an
phone	30 / an
fax	30 / an
tax1	30 / an
tax2	30 / an
tax3	30 / an
shipping_cost	30 / an

Item Information

NOTE: You may send multiple items. Please refer to section 8 - Purchase (with Customer and Order details) for an example.

item_description	30 / an	
item_quantity	10 / num	You must send a quantity > 0 or the item will not be added to the item list (ie. minimum 1, maximum 9999999999)
item_product_code	30 / an	
item_extended_amount	9 / decimal	This must contain 3 digits with two penny values. The minimum value passed can be 0.01 and the maximum 9999999.99

Extra Details

email	50 / an
instructions	50 / an

If you send characters that are not included in the allowed list, these extra transaction details may not be stored.

NOTE

All fields are alphanumeric and allow the following characters: **a-z A-Z 0-9 _ - . @ \$ = /**

Also, the data sent in Billing and Shipping Address fields will not be used for any address verification. Please refer to the section 8 – Purchase (with CVD and AVS - eFraud).

29. Appendix D. Recur and Recur Update Fields

Recur Request Fields		
Variable Name	Size/Type	Description
recur_unit	day, week, month, eom	The unit that you wish to use as a basis for the Interval. This can be set as day, week, month or end of month. Then using the "period" field you can configure how many days, weeks, months between billing cycles.
period	0 – 999 / num	This is the number of recur_units you wish to pass between billing cycles. Example : period = 45, recur_unit=day -> Card will be billed every 45 days. period = 4, recur_unit=weeks -> Card will be billed every 4 weeks. period = 3, recur_unit=month -> Card will be billed every 3 months. period = 3, recur_unit=eom -> Card will be billed every 3 months (on the last day of the month) Please note that the total duration of the recurring billing transaction should not exceed 5-10 years in the future.
start_date	YYYY/MM/DD	This is the date on which the first charge will be billed. The value must be in the future. It cannot be the day on which the transaction is being sent. If the transaction is to be billed immediately the start_now feature must be set to true and the start_date should be set at the desired interval after today.
start_now	true / false	When a charge is to be made against the card immediately start_now should be set to 'true'. If the billing is to start in the future then this value is to be set to 'false'. When start_now is set to 'true' the amount to be billed immediately may differ from the recur amount billed on a regular basis thereafter.
recur_amount	9 / decimal	Amount of the recurring transaction. This must contain 3 digits with two penny values. The minimum value passed can be 0.01 and the maximum 9999999.99. This is the amount that will be billed on the start_date and every interval thereafter.
num_recur	1 – 99 / num	The number of times to recur the transaction.
amount	9 / decimal	When start_now is set to 'true' the amount field in the transaction array becomes the amount to be billed immediately. When start_now is set to 'false' the amount field in the transaction array should be the same as the recur_amount field.

Recur Request Examples	
Recur Request Examples	Description
<pre>recur_unit = "month"; start_now = "false"; start_date = "2007/01/02"; num_recur = "12"; period = "2"; recur_amount = "30.00"; Set request1 = server.CreateObject("Moneris.USPurchase") request1.setRecur recur_unit, start_now, start_date, num_recur, period, recur_amount out.setRequest request1.formatRequest(order_id, amount, pan, exp_date, crypt_type) out.sendRequest</pre>	<p>In the example to the left the first transaction will occur in the future on Jan 2nd 2007. It will be billed \$30.00 every 2 months on the 2nd of each month. The card will be billed a total of 12 times.</p>

```

recur_unit = "week";
start_now = "true";
start_date = "2007/01/02";
num_recur = "26";
period = "2";
recur_amount = "30.00";

Set request1 =
server.CreateObject("Moneris.USBPurchase")
    request1.setRecur recur_unit, start_now,
start_date, num_recur, period, recur_amount

out.setRequest request1.formatRequest(
    order_id, amount, pan, exp_date, crypt_type)
out.sendRequest

```

In the example on the left the first charge will be billed immediately. The initial charge will be for \$15.00. Then starting on Jan 2nd 2007 the credit card will be billed \$30.00 every 2 weeks for 26 recurring charges. The card will be billed a total of 27 times. (1 x \$15.00 (immediate) and 26 x \$30.00 (recurring))

**NOTE**

When completing the recurring billing portion please keep in mind that to prevent the shifting of recur bill dates, avoid setting the start_date for anything past the 28th of any given month. For example, all billing dates set for the 31st of May will shift and bill on the 30th in June and will then bill the cardholder on the 30th for every subsequent month.

Recur Update Request Fields

Variable Name	Size/Type	Description
cust_id	50 / an	This updates the current cust_id associated with the recurring transaction and will be submitted with all future recurring purchases.
pan	20 / variable	Credit Card Number - no spaces or dashes. Most credit card numbers today are 16 digits in length but some 13 digits are still accepted by some issuers. This field has been intentionally expanded to 20 digits in consideration for future expansion and/or potential support of private label card ranges. This will be the new credit card number charged with all future recurs. This field pertains only to credit card and Pinless Debit transactions.
expiry_date	YYMM / num	Expiry Date - format YYMM no spaces or slashes, replaces the current expiry date in the payment details and must be today's date or later. PLEASE NOTE THAT THIS IS REVERSED FROM THE DATE DISPLAYED ON THE PHYSICAL CARD WHICH IS MMY
avs_street_number	19 / an	Street Number & Street Name (max – 19 digit limit for street number and street name combined). This must match the address that the issuing bank has on file. The updated AVS details will be submitted for all future credit card recurs. Please note; the store must have the AVS feature enabled.
avs_street_name		
avs_zipcode	9 / an	Zip or Postal Code – This must match what the issuing bank has on file.
recur_amount	9 / decimal	Amount of all future recurring transaction. This must contain 3 digits with two penny values. The minimum value passed can be 0.01 and the maximum 9999999.99.
add_num	1-999 / num	This is the number of recurring transactions to be added to the current total number of recurs on file. Example: num_recur* = 5, add_num = 2, New total number of recurs = 7 *the “num_recur” initially sent in while registering the recurring transaction. Please refer to Recur Request Fields table for variable definition.
total_num	1-999 / num	This is an update to replace the current total number of recurs on file. Example: num_recur* = 5, total_num = 2, New total number of recurs = 2 *the “num_recur” initially sent in while registering the recurring transaction.

Please refer to Recur Request Fields table for variable definition.		
hold	true / false	A transaction can be put 'On Hold' at any time. While a transaction is 'On Hold' it will not be billed when the time comes for it to recur, but the number of recurs will be decremented.
terminate	true / false	A Recurring Billing transaction can be Terminated at any time. PLEASE NOTE TERMINATED RECURRING TRANSACTION CAN NO LONGER BE REACTIVATED.

**NOTE**

When completing the Recur Update portion please keep in mind that the profile cannot be changed to have a new end date greater than 10 years from today. Also the new end date cannot be today or earlier.

Once a Recurring Billing profile has been terminated it can no longer be reactivated.

Recur Update Response codes:

The Recur Update response is a 3 digit numeric value. The following is a list of all possible responses once a Recur Update transaction has been sent thru.

Recur Update Response Codes	
RESULT VALUE	DEFINITION
001	Recurring transaction successfully updated (optional: terminated)
983	Can not find the previous transaction
984	Data error: (optional: field name)
985	Invalid number of recurs
986	Incomplete: timed out
null	Error: Malformed XML

30. Appendix E. Pinless Debit Fields

Pinless Debit Request Fields		
Variable Name	Size/Type	Description
presentation_type	1 / alpha	Identifies how merchants obtain the Pinless Debit account. - 'X' for Telephone/VRU - 'W' for Internet
intended_use	1 / num	Identifies the party who initiated the transaction. - "0" = Merchant initiated the payment - "1" = Customer initiated the payment
p_account_number	25 / num	The billing invoice number – no spaces or dashes. The length of the account number varies with a maximum length of 25 digits.

Pinless Debit Customer Information

NOTE: The following Account Holder information fields are optional.

first_name	50 / an	
last_name	50 / an	
address	50 / an	
address2	50 / an	
city	50 / an	
state	2 / alpha	The state must be submitted as exactly 2 characters (ex. MI – Michigan)
zip_code	15 / an	

If you send characters that are not included in the allowed list, the Pinless Debit transaction may not be properly registered.

NOTE

All alphanumeric fields allow the following characters: **a-z A-Z 0-9 _ - : . @ \$ = /**

Also, the data sent in the Pinless Debit Customer Information fields will not be used for any address verification.

31. Appendix F. AchInfo Fields

AchInfo Request Fields		
Variable Name	Size/Type	Description
sec	3 / an	ACH sec Code: The following sec codes apply only if check not physically present. ppd - Prearranged Payment and Deposit ccd - Cash Concentration or Disbursement web - Internet Initiated Entry Please refer to Appendix G. ACH Sec Codes and Process Flow for full sec code description
routing_num	9 / num	The first number in the MICR, or magnetic ink character recognition, line at the bottom of a check is the bank's check routing number. It is exactly nine digits long and always starts with 0, 1, 2 or 3.
account_num	50 / num	The account number may appear before or after the check number in the check's MICR line at the bottom of the check. The length of the account number varies with a maximum length of 50 digits.
check_num	16 / num	The sequential number for checks appears in both the MICR line at the bottom of the check and the upper right corner of the check. The check number length may vary; the maximum length is 16 digits. This is an optional field.
account_type	savings / checking	Identifies the type of bank account. The account type must be submitted as either 'savings' or 'checking'. This field is case sensitive.
dl_num	an	The first two characters of this field should be the State Code of the Driver's License, followed by a dash (ASCII 45), then the ID Data. e.g. Colorado: dl_num = "CO-12312312";
magstripe	yes / no	Fixed value. The magstripe data is obtained when scanning the Driver's License.
image_front	an	The front image of the check obtained from the scanner, base64 encoded.
image_back	an	The back image of the check obtained from the scanner, base64 encoded.

ACH Customer Information

NOTE: The following Account Holder information fields are optional.

cust_first_name	50 / an	
cust_last_name	50 / an	
cust_address1	50 / an	
cust_address2	50 / an	
cust_city	50 / an	
cust_state	2 / alpha	The state must be submitted as exactly 2 characters (ex. MI – Michigan)
cust_zip	15 / an	

NOTE

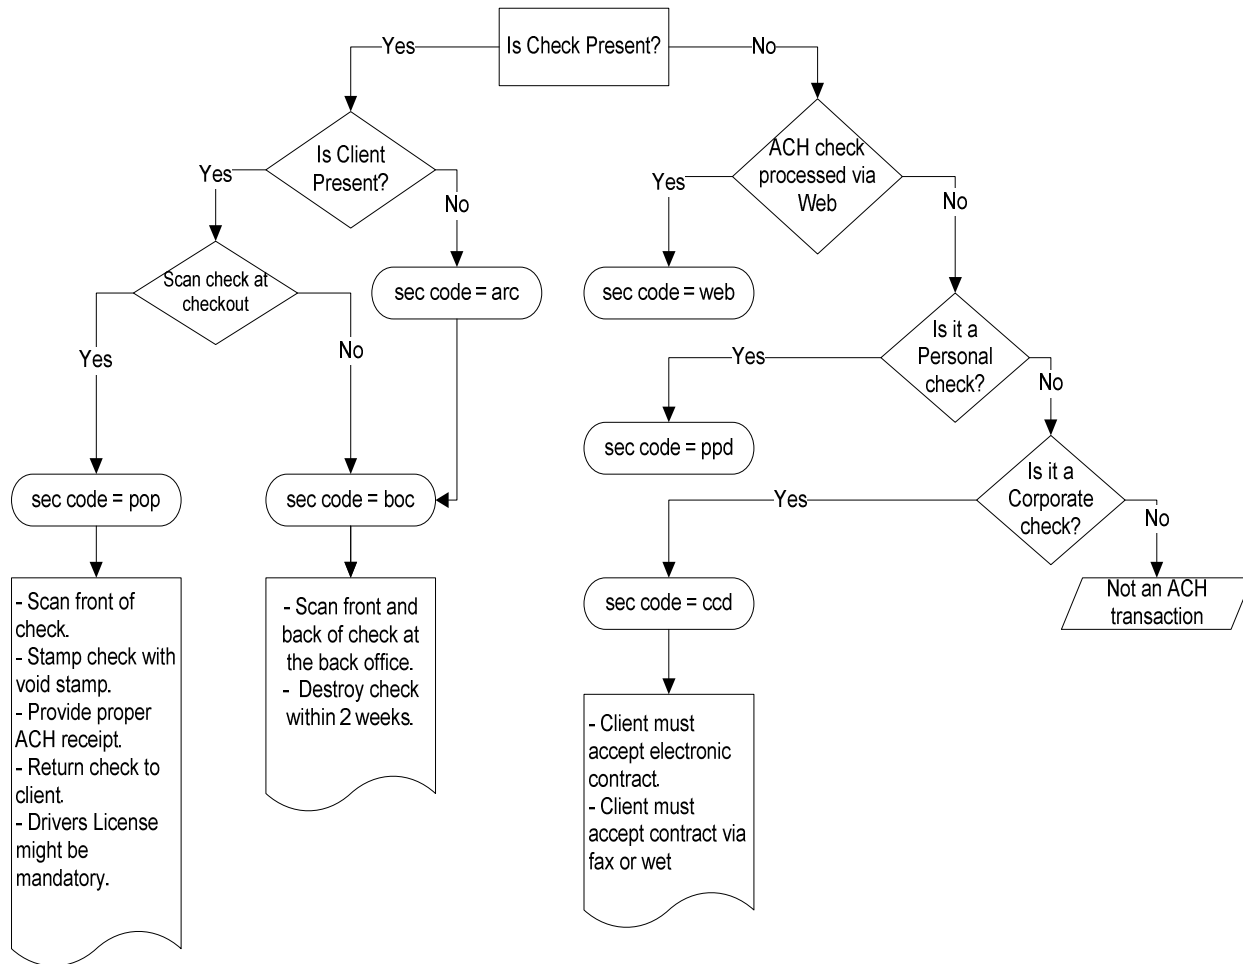

If you send characters that are not included in the allowed list, the ACH transaction may not be properly registered.

All alphanumeric fields allow the following characters: **a-z A-Z 0-9 _ - . : . @ \$ = /**

Also, the data sent in the ACH Customer Information fields will not be used for any address verification.

32. Appendix G. ACH Sec Codes and Process Flow

ACH Sec Codes		
Variable Name	Size/Type	Description
sec	3 / an	<p><i>The following SEC codes apply only if check is not physically present:</i></p> <p>PPD – (Prearranged Payment and Deposit) Debit (Sale): Consumer grants the merchant the right to initiate a one time or recurring charge(s) to his or her account as bills become due. Credit (Refund): Transfers funds into a consumer's bank account. The funds being deposited can represent a variety of financial transactions, such as payroll, interest, pension, dends, etc.</p> <p>CCD – (Cash Concentration or Disbursement) Debit (Sale): Client grants the merchant the right to initiate a one time or recurring charge(s) to a business bank account. Credit (Refund): Transfer funds to a client's business bank account.</p> <p>WEB – (Internet Initiated Entry) Debit (Sale): A Debit entry to a consumer's bank account initiated by a merchant. The consumer's authorization is obtained via the Internet. Credit (Refund): N/A.</p> <p>* only 'ppd' and 'ccd' apply to the ACH Credit transaction</p>

Process Flow for ACH Transactions

33. Appendix H. ProglDs

Request Object Moneris.USRequest

The following 22 are ProglDs for request formatters.

Purchase Request	Moneris.USPurchase
CavvPurchase Request	Moneris.USCavvPurchase
CavvPreauth Request	Moneris.USCavvPreauth
PurchaseCorrection Request	Moneris.USPurchaseCorrection
BatchClose Request	Moneris.USBatchClose
Completion Request	Moneris.USCompletion
Refund Request	Moneris.USRefund
PreAuth Request	Moneris.USPreauth
ReAuth Request	Moneris.USReauth
OpenTotals Request	Moneris.USOpenTotals
IndependentRefund Request	Moneris.USIndependentRefund
Card Verification Request	Moneris.USCardVerify
ForcePost Request	Moneris.USForcepost
Encrypted Purchase Request	Moneris.USEncPurchase
Encrypted PreAuth Request	Moneris.USEncPreauth
Encrypted IndependentRefund Request	Moneris.USEncIndRefund
Encrypted Card Verification Request	Moneris.USEncCardVerification
Encrypted ForcePost Request	Moneris.USEncForcePost
Mag Swipe Purchase Request	Moneris.USTrack2Purchase
Mag Swipe PurchaseCorrection Request	Moneris.USTrack2PurchaseCorrection
Mag Swipe Completion Request	Moneris.USTrack2Completion
Mag Swipe Refund Request	Moneris.USTrack2Refund
Mag Swipe PreAuth Request	Moneris.USTrack2Preauth
Mag Swipe IndependentRefund Request	Moneris.USTrack2IndependentRefund
Mag Swipe ForcePost Request	Moneris.USTrack2Forcepost
Encrypted Mag Swipe Purchase Request	Moneris.USEncTrack2Purchase
Encrypted Mag Swipe PreAuth Request	Moneris.USEncTrack2Preauth
Encrypted Mag Swipe Ind Refund Request	Moneris.USEncTrack2IndependentRefund
Encrypted Mag Swipe ForcePost Request	Moneris.USEncTrack2ForcePost
USPinlessDebitPurchaseRequest	Moneris.USPinlessDebitPurchase
USPinlessDebitRefundRequest	Moneris.USPinlessDebitRefund
Ach Credit Request	Moneris.USAchCredit
Ach Debit Request	Moneris.USAchDebit
Ach Fi Enquiry Request	Moneris.USAchFiEnquiry
Ach Reversal Request	Moneris.USAchReversal

34. Appendix I. Method List

All methods return HRESULTS. If a method is successful it will return a S_OK result. Possible HRESULTs are listed in the description of the method and a complete list of HRESULT errors with values is provided in the next section. In languages that are based on visual basic the HRESULTS will either throw error codes that should be trapped using "on error".

F.1. Moneris.USRequest

HRESULT sendRequest();
Sends a request to Moneris to be processed.

HRESULT initRequest([in] BSTR store_id,
[in] BSTR api_token,
[in] BSTR gateway_url);
Initializes the Request Object. Obtain store_id, api_token and gateway_url from Moneris Solutions.

HRESULT setRequest([in] BSTR request);
Sets the request in the Request Object. Use the result of the formatRequest method of the Formatter Objects as the input to this method.

HRESULT dumpXMLResponse([out,retval] BSTR *xmlresponse);
Returns the receipt as an XML string.

The next set of methods get individual parts of the receipt.

HRESULT getReceiptID([out, retval] BSTR * receiptid);
HRESULT getReferenceNum([out, retval] BSTR * referencenum);
HRESULT getResponseCode([out, retval] BSTR * responsecode);
HRESULT getAuthCode([out, retval] BSTR * authcode);
HRESULT getTransTime([out, retval] BSTR * transtime);
HRESULT getTransDate([out, retval] BSTR * transdate);
HRESULT getTransType([out, retval] BSTR * transtype);
HRESULT getCompleteStatus([out, retval] BSTR * complete);
HRESULT getMessage([out, retval] BSTR * message);
HRESULT getTransAmount([out, retval] BSTR * amount);
HRESULT getCardType([out, retval] BSTR * cardtype);
HRESULT getTransID([out, retval] BSTR * transid);
HRESULT getTimedOutStatus([out, retval] BSTR * timedout);
HRESULT getBankTotals([out, retval] BSTR * banktotals);
HRESULT getRecurSuccess([out, retval] BSTR * recursuccess);
HRESULT getAysResultCode([out, retval] BSTR * AysResultCode);
HRESULT getCvdResultCode([out, retval] BSTR * CvdResultCode);
HRESULT getCardLevelResult([out, retval] BSTR * CardLevelResult);
HRESULT getCavvResultCode([out, retval] BSTR * CavvResultCode);
HRESULT getStatusCode([out, retval] BSTR * StatusCode);
HRESULT getStatusMsg([out, retval] BSTR * StatusMsg);
HRESULT getMaskedPan([out, retval] BSTR * MaskedPan);

F.2. Moneris.USPurchase

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR amount,
[in] BSTR pan,
[in] BSTR exp_date,
[in] BSTR crypt_type,
[out, retval] BSTR * xmlrequest);

Formats a request to send a purchase transaction. To send additional information please see the section on Extra Details (F.4).

F.3. Moneris.USPreauth

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR pan,  
                      [in] BSTR exp_date,  
                      [in] BSTR crypt_type,  
                      [out, retval] BSTR * xmlrequest);
```

Formats a Preauthorisation request.

F.4. Moneris.USReauth

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR orig_order_id,  
                      [in] BSTR txn_number,  
                      [in] BSTR amount,  
                      [in] BSTR crypt_type,  
                      [out, retval] BSTR * xmlrequest);
```

Formats a Reauthorisation request.

F.5. Extra Details

The next 6 methods are for setting additional information. Refer to section 7 and 8 regarding the use of these methods.

```
HRESULT setCustId([in] BSTR cust_id);  
HRESULT setCustInfo([in] BSTR billing,  
                   [in] BSTR shipping,  
                   [in] BSTR email,  
                   [in] BSTR instructions);  
HRESULT setItem([in] BSTR name,  
               [in] BSTR quantity,  
               [in] BSTR product_code,  
               [in] BSTR extended_amount);  
  
HRESULT formatAddress([in] BSTR first_name,  
                     [in] BSTR last_name,  
                     [in] BSTR company_name,  
                     [in] BSTR address,  
                     [in] BSTR city,  
                     [in] BSTR province,  
                     [in] BSTR postal_code,  
                     [in] BSTR country,  
                     [in] BSTR phone_number,  
                     [in] BSTR fax,  
                     [in] BSTR tax1,  
                     [in] BSTR tax2,  
                     [in] BSTR tax3,  
                     [in] BSTR shipping_cost,  
                     [out, retval] BSTR * xmladdress);  
HRESULT setRecur([in] BSTR recur_unit,  
                 [in] BSTR start_now,  
                 [in] BSTR start_date,  
                 [in] BSTR num_rekurs  
                 [in] BSTR period,  
                 [in] BSTR recur_amount);  
HRESULT setAvsInfo([in] BSTR avs_street_number,  
                   [in] BSTR avs_street_name,  
                   [in] BSTR avs_zipcode);  
HRESULT setCvdInfo([in] BSTR cvd_indicator,
```

```
[in] BSTR cvd_value);  
HRESULT setCommcardInvoice([in] BSTR commcard_invoice);  
HRESULT setCommcardTaxAmount([in] BSTR commcard_tax_amount);
```

F.6. Moneris.USCompletion

```
HRESULT formatRequest([in] BSTR order_id,  
    [in] BSTR comp_amount,  
    [in] BSTR txn_number,  
    [in] BSTR crypt_type,  
    [out,retval] BSTR * xmlrequest);
```

Formats a request to complete a preauthorisation. The USCompletion is required to have a preauthorisation settled into your account. The txn_number is the transid from the preauth and the order_id needs to be the same as the original preauth.

F.7. Moneris.USPurchaseCorrection

```
HRESULT formatRequest([in] BSTR order_id,  
    [in] BSTR txn_number,  
    [in] BSTR crypt_type,  
    [out, retval] BSTR * xmlrequest);
```

Format a request to cancel a completion or purchase. The USPurchaseCorrection must be performed before the batch is closed (settled). The txn_number is the transid from the USCompletion (not the preauth) or the USPurchase. The order_id needs to be the same as the transaction that is being cancelled.

F.8. Moneris.USRefund

```
HRESULT formatRequest([in] BSTR order_id,  
    [in] BSTR amount,  
    [in] BSTR txn_number,  
    [in] BSTR crypt_type,  
    [out, retval] BSTR * xmlrequest);
```

Formats a request to send a refund. The txn_number and order_id must be the same as the completion or purchase.

F.9. Moneris.USIndependentRefund

```
HRESULT formatRequest([in] BSTR order_id,  
    [in] BSTR amount,  
    [in] BSTR pan,  
    [in] BSTR exp_date,  
    [in] BSTR crypt_type,  
    [out, retval] BSTR * xmlrequest);
```

Formats a request to send an independent refund. The independent refund does not need to have an existing purchase/completion.

F.10. Moneris.USForcepost

```
HRESULT formatRequest([in] BSTR order_id,  
    [in] BSTR amount,  
    [in] BSTR pan,  
    [in] BSTR exp_date,  
    [in] BSTR auth_code,  
    [in] BSTR crypt_type,  
    [out, retval] BSTR * xmlrequest);
```

F.11. Moneris.USCardVerify

```
HRESULT formatRequest([out, retval] BSTR * xmlrequest);  
Formats a Card Verification request. The following may be set individually.
```

```

HRESULT setCustId([in] BSTR cust_id);
HRESULT setOrderId([in] BSTR order_id);
HRESULT setPan([in] BSTR pan);
HRESULT setExpdate([in] BSTR exp_date);
HRESULT setAvsInfo([in] BSTR avs_street_number,
[in] BSTR avs_street_name,
[in] BSTR avs_zipcode);
HRESULT setCvdInfo([in] BSTR cvd_indicator,
[in] BSTR cvd_value);

```

F.12. Moneris.USEncPurchase

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR amount,
[in] BSTR enc_track2,
[in] BSTR device_type,
[in] BSTR crypt_type,
[out, retval] BSTR * xmlrequest);

```

Formats a request to send a purchase transaction. To send additional information please see the section on Extra Details.

F.13. Moneris.USEncPreauth

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR amount,
[in] BSTR enc_track2,
[in] BSTR device_type,
[in] BSTR crypt_type,
[out, retval] BSTR * xmlrequest);

```

Formats a Preauthorisation request.

F.14. Moneris.USEncIndRefund

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR amount,
[in] BSTR enc_track2,
[in] BSTR device_type,
[in] BSTR crypt_type,
[out, retval] BSTR * xmlrequest);

```

Formats a request to send an independent refund. The independent refund does not need to have an existing purchase/completion.

F.15. Moneris.USEncForcePost

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR amount,
[in] BSTR enc_track2,
[in] BSTR device_type,
[in] BSTR auth_code,
[in] BSTR crypt_type,
[out, retval] BSTR * xmlrequest);

```

F.16. Moneris.USEncCardVerification

```

HRESULT formatRequest (
[in] BSTR order_id,
[in] BSTR enc_track2,
[in] BSTR device_type,
[in] BSTR avs_info,
[out, retval] BSTR* xmlrequest);
HRESULT setCustId([in] BSTR cust_id);
HRESULT setAvsInfo(

```

```

[in] BSTR avs_street_number,
[in] BSTR avs_street_name,
[in] BSTR avs_zipcode,
[out, retval] BSTR* avs_info);
HRESULT setCvdInfo(
[in] BSTR cvd_indicator,
[in] BSTR cvd_value);

```

F.17. Moneris.USBatchClose

```

HRESULT formatRequest([in] BSTR ecr_number,
[out, retval] BSTR * xmlrequest);

```

Formats a request to close a specific terminal.

F.18. Moneris.USOpenTotals

```

HRESULT formatRequest([in] BSTR ecr_number,
[out, retval] BSTR * xmlrequest);

```

Formats a request that will retrieve the current batch totals from the Moneris Bank Host.

F.19. Moneris.USTrack2Purchase

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR amount,
[in] BSTR track2,
[in] BSTR pan,
[in] BSTR exp_date,
[in] BSTR pos_code,
[out, retval] BSTR * xmlrequest);

```

Formats a request to send a purchase transaction with a track2, by using the mag swipe. To send additional information please see the section on Extra Details (F.4).

F.20. Moneris.USTrack2Preauth

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR amount,
[in] BSTR track2,
[in] BSTR pan,
[in] BSTR exp_date,
[in] BSTR pos_code,
[out, retval] BSTR * xmlrequest);

```

Formats a Mag Swipe Preauthorisation request by submitting the track2.

F.21. Moneris.USTrack2Completion

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR comp_amount,
[in] BSTR txn_number,
[in] BSTR pos_code,
[out,retval] BSTR * xmlrequest);

```

Formats a request to complete a mag swipe preauthorisation. The USTrack2Completion is required to have a preauthorisation settled into your account. The txn_number is the transid from the preauth and the order_id needs to be the same as the original preauth.

F.22. Moneris.USTrack2PurchaseCorrection

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR txn_number,
[out, retval] BSTR * xmlrequest);

```

Format a request to cancel a mag swipe completion or purchase. The USTrack2PurchaseCorrection must be performed before the batch is closed (settled). The txn_number is the transid from the USTrack2Completion (not the preauth) or the USTrack2Purchase. The order_id needs to be the same as the transaction that is being cancelled.

F.23. Moneris.USTrack2Refund

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR txn_number,  
                      [out, retval] BSTR * xmlrequest);
```

Formats a request to send a mag swipe refund. The txn_number and order_id must be the same as the completion or purchase.

F.24. Moneris.USTrack2IndependentRefund

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR track2,  
                      [in] BSTR pan,  
                      [in] BSTR exp_date,  
                      [in] BSTR pos_code,  
                      [out, retval] BSTR * xmlrequest);
```

Formats a request to send a mag swipe independent refund allowing you to submit the track2. The independent refund does not need to have an existing purchase/completion.

F.25. Moneris.USTrack2Forcepost

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR track2,  
                      [in] BSTR pan,  
                      [in] BSTR exp_date,  
                      [in] BSTR pos_code,  
                      [in] BSTR auth_code,  
                      [out, retval] BSTR * xmlrequest);
```

F.26. Moneris.USEncTrack2Purchase

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR enc_track2,  
                      [in] BSTR pos_code,  
                      [in] BSTR device_type,  
                      [out, retval] BSTR * xmlrequest);
```

Formats a request to send a purchase transaction with an encrypted track2, by using the encrypted mag swipe reader. To send additional information please see the section on Extra Details (F.4).

F.27. Moneris.USEncTrack2Preauth

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR enc_track2,  
                      [in] BSTR pos_code,  
                      [in] BSTR device_type,  
                      [out, retval] BSTR * xmlrequest);
```

Formats an Encrypted Mag Swipe Preauthorisation request by submitting the encrypted track2 value.

F.28. Moneris.USEncTrack2IndependentRefund

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR enc_track2,  
                      [in] BSTR pos_code,  
                      [in] BSTR device_type,  
                      [out, retval] BSTR * xmlrequest);
```

Formats a request to send an encrypted mag swipe independent refund allowing you to submit the encrypted track2 value. The independent refund does not need to have an existing purchase/completion.

F.29. Moneris.USEncTrack2ForcePost

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR enc_track2,  
                      [in] BSTR device_type,  
                      [in] BSTR pos_code,  
                      [in] BSTR auth_code,  
                      [out,retval] BSTR * xmlrequest);
```

F.30. Moneris.USPinlessDebitPurchase

```
HRESULT formatRequest([in] BSTR order_id,  
                      [in] BSTR amount,  
                      [in] BSTR pan,  
                      [in] BSTR presentation_type,  
                      [in] BSTR intended_use,  
                      [in] BSTR p_account_number,  
                      [out,retval] BSTR* xmlrequest);  
HRESULT setCustId([in] BSTR cust_id);  
HRESULT setExpDate([in] BSTR expdate);  
HRESULT formatAddress([in] BSTR first_name,  
                     [in] BSTR last_name,  
                     [in] BSTR company_name,  
                     [in] BSTR address,  
                     [in] BSTR city,  
                     [in] BSTR province,  
                     [in] BSTR postal_code,  
                     [in] BSTR country,  
                     [in] BSTR phone_number,  
                     [in] BSTR fax,  
                     [in] BSTR tax1,  
                     [in] BSTR tax2,  
                     [in] BSTR tax3,  
                     [in] BSTR shipping_cost,  
                     [out,retval] BSTR* xmladdress);  
HRESULT setItem([in] BSTR name,  
               [in] BSTR quantity,  
               [in] BSTR product_code,  
               [in] BSTR extended_amount);  
HRESULT setCustInfo([in] BSTR billing,  
                   [in] BSTR shipping,  
                   [in] BSTR email,  
                   [in] BSTR instructions);  
HRESULT setRecur([in] BSTR recur_unit,  
                [in] BSTR start_now,  
                [in] BSTR start_date,  
                [in] BSTR num_recur,  
                [in] BSTR period,  
                [in] BSTR recur_amount);
```

Formats a request to send a Pinless Debit transaction.

F.31. Moneris.USPinlessDebitRefund

```
HRESULT formatRequest([in] BSTR order_id,  
                     [in] BSTR txn_number,
```

```

Formats a request to send an ACH Financial Inquiry.

```

F.35. Moneris.USAchReversal

```

HRESULT formatRequest([in] BSTR order_id,
[in] BSTR txn_number,
[out,retval] BSTR* xmlrequest);
Formats a request to send an ACH Reversal transaction.

```

35. Appendix J. Error Messages

E_GATEWAY_CONNECTION	0x80040407	-2147220473
E_BAD_GATEWAY_URL	0x8004040d	-2147220467
E_UNABLE_TO_PARSE_CONFIG	0x80040411	-2147220463
E_CANNOT_GET_HSESSION	0x80040412	-2147220462
E_CANNOT_GET_HCONNECTION	0x80040413	-2147220461
E_CANNOT_GET_HRESULTS	0x80040414	-2147220460
E_HEADER_PROBLEM	0x80040415	-2147220459
E_OPTION_PROBLEM	0x80040416	-2147220458

Response Code = NULL – The response code can be returned as null for a variety of reasons. A majority of the of the time the explanation is contained within the Message field. When a 'NULL' response is returned it can indicate that the Issuer, the credit card host, or the gateway is unavailable, either because they are offline or you are unable to connect to the internet. A 'NULL' can also be returned when a transaction message is improperly formatted.

36. Appendix K. Card Validation Digits (CVD)

The Card Validation Digits (CVD) value refers to the numbers appearing on the back of the credit card which are not imprinted on the front. The exception to this is with American Express cards where this value is indeed printed on the front. The CvdInfo parameter is broken down into two elements. The first element is the CVD Value itself.

The second element is the CVD Indicator. This value indicates the possible scenarios when collecting CVD information. This is a 1 digit value which can have any of the following values:

CVD INDICATOR	
VALUE	DEFINITION
0	CVD value is deliberately bypassed or is not provided by the merchant.
1	CVD value is present.
2	CVD value is on the card, but is illegible.
9	Cardholder states that the card has no CVD imprint.

CVD Response codes:

The CVD response is an alphanumeric 2 byte variable. The first byte is the numeric CVD indicator sent in the request; the second byte would be the response code. The following is a list of all possible responses once a CVD value has been passed in.

CVD RESPONSE CODES	
RESULT VALUE	DEFINITION
M	Match
Y	Match for AmEx
N	No Match
P	Not Processed
S	CVD should be on the card, but Merchant has indicated that CVD is not present
R	Retry for AmEx
U	Issuer is not a CVD participant
Other	Invalid Response Code

The CVD value supplied by the cardholder should simply be passed to the eSELECTplus payment gateway. Under no circumstances should it be stored for subsequent uses or displayed as part of the receipt information.

***For additional information on how to handle these responses, please refer to Appendix M. Additional Information for CVD and AVS.**

37. Appendix L. Address Verification Service (AVS)

The Address Verification Service (AVS) value refers to the cardholder's street number, street name and zip/postal code as it would appear on their statement. AvsInfo is broken down into three elements:

Element	Type	Length
Street Number	Numeric	19 characters combined.
Street Name	Alphanumeric	
Zip/Postal Code	Alphanumeric	9 characters

The following table outlines the possible responses when passing in AVS information.

AVS RESPONSE CODES		
VALUE	VISA/DISCOVER / JCB	MASTERCARD
A	Address matches, ZIP does not. Acquirer rights not implied.	Address matches, zip code does not.
B	Street addresses match. Zip code not verified due to incompatible formats. (Acquirer sent both street address and zip code.)	N/A
C	Street addresses not verified due to incompatible formats. (Acquirer sent both street address and zip code.)	N/A
D	Street addresses and zip codes match.	N/A
F	Street address and zip code match. Applies to U.K. only	N/A
G	Address information not verified for international transaction. Issuer is not an AVS participant, or AVS data was present in the request but issuer did not return an AVS result, or Visa performs AVS on behalf of the issuer and there was no address record on file for this account.	N/A
I	Address information not verified.	N/A
K	N/A	N/A
L	N/A	N/A
M	Street address and zip code match.	N/A
N	No match. Acquirer sent postal/ZIP code only, or street address only, or both zip code and street address. Also used when acquirer requests AVS but sends no AVS data.	Neither address nor zip code matches.
O	N/A	N/A
P	Zip code match. Acquirer sent both zip code and street address but street address not verified due to incompatible formats.	N/A
R	Retry: system unavailable or timed out. Issuer ordinarily performs AVS but was unavailable. The code R is used by Visa when issuers are unavailable. Issuers should refrain from using this code.	Retry; system unable to process.
S	N/A	AVS currently not supported.
U	Address not verified for domestic transaction. Issuer is not an AVS participant, or AVS data was present in the request but issuer did not return an AVS result, or Visa performs AVS on behalf of the issuer and there was no address record on file for this account.	No data from Issuer/Authorization system.
W	Not applicable. If present, replaced with 'Z' by Visa. Available for U.S. issuers only.	For U.S. Addresses, nine-digit zip code matches, address does not; for address outside the U.S. postal code matches, address does not.
X	N/A	For U.S. addresses, nine-digit zip code and addresses matches; for addresses outside the U.S., postal code and address match.
Y	Street address and zip code match.	For U.S. addresses, five-digit zip code and address matches.
Z	Postal/Zip matches; street address does not match or street address not included in request.	For U.S. addresses, five digit zip code matches, address does not.

VALUE	AMERICAN EXPRESS
A	Billing address matches, zip code does not
D	Customer name incorrect, zip code matches
E	Customer name incorrect, billing address and zip code match
F	Customer name incorrect, billing address matches
K	Customer name matches
L	Customer name and zip code match
M	Customer name, billing address, and zip code match
N	Billing address and zip code do not match
O	Customer name and billing address match
R	System unavailable; retry
S	AVS not currently supported
U	Information is unavailable
W	Customer name, billing address, and zip code are all incorrect
Y	Billing address and zip code both match
Z	Zip code matches, billing address does not

38. Appendix M. Additional Information for CVD and AVS

The responses that are received from CVD and AVS verifications are intended to provide added security and fraud prevention, but the response itself will not affect the completion of a transaction. Upon receiving a response, the choice to proceed with a transaction is left entirely to the merchant.

Please note that all responses coming back from these verification methods are not direct indicators of whether a merchant should complete any particular transaction. The responses should not be used as a strict guideline of which transaction will approve or decline.

NOTE

Please note that CVD and AVS verification is only applicable towards Visa, MasterCard, Discover, JCB and American Express transactions.

39. Appendix N. Card Level Result Value

The Card Level Result value refers to the issuer-supplied data on file in the Cardholder Database. Visa and MasterCard will populate this field with an appropriate product identification value which can be used to track card-level activity by an individual account number. These details will be populated within the CardLevelResult response field when returned by the associations.

The following table outlines the possible Card Level Result responses.

CARD LEVEL RESULT VALUE			
VALUE	VISA	VALUE	VISA
A	Visa Classic/Traditional	L	Electron
AX	American Express	M	MasterCard/Euro Card and Diners
B	Visa Gold/Platinum/Traditional Rewards	N	Visa Platinum
C	Visa Signature	N1	TBA
D	Visa Signature Preferred/Visa Infinite	O	Reserved
DI	Discover	P	Visa Gold
E	Reserved	Q	Private Label
F	Visa Classic	Q1	Private Label Prepaid
G	Visa Business	R	Proprietary
G1	Visa Signature Business	S	Visa Purchasing
G2	Visa Business Check Card	S1	Visa Purchasing with Fleet
G3	Visa Enhanced Business	S2	Visa GSA Purchasing
H	Visa Check Card/Debit	S3	Visa GSA Purchasing with Fleet
I	Visa Infinite	S4	Commercial Business Loan
J	Reserved	S5	Commercial Transport EBT
J1	Visa General Prepaid	S6	Business Loan
J2	Visa Prepaid Gift	S7	Visa Distribution

40. Appendix O. CAVV Result Code

The Cardholder Authentication Verification Value (CAVV) is a value that allows VisaNet to validate the integrity of the VBV transaction data. The merchant integrates the CAVV value into the authorization request using the 'formCavvPurchaseArray' or 'formCavvPreauthArray' transaction type. These CAVV Result Code values are passed back from the issuer to the merchant after the VBV authorization request has taken place. For more information on sending VBV transactions, please refer to our "Moneris MPI - Verified By Visa / MasterCard SecureCode COM API" document.

Please note that the CAVV Result Code is only applicable towards Visa transactions.

The following table describes the contents of the CAVV data response and what it means to the merchant.

Table of CAVV result codes		
Result Code	Message	What this means to you as a merchant...
0	CAVV authentication results invalid.	For this transaction you may not receive protection from chargebacks as a result of using VBV as the CAVV was considered invalid at the time the financial transaction was processed. Please check that you are following the VBV process correctly and passing the correct data in our transactions.
1	CAVV failed validation; authentication	Provided that you have implemented the VBV process correctly the liability for this transaction should remain with the Issuer for chargeback reason codes covered by Verified by Visa.
2	CAVV passed validation; authentication	The CAVV was confirmed as part of the financial transaction. This transaction is a fully authenticated VBV transaction (ECI 5)
3	CAVV passed validation; attempt	The CAVV was confirmed as part of the financial transaction. This transaction is an attempted VBV transaction (ECI 6)
4	CAVV failed validation; attempt	Provided that you have implemented the VBV process correctly the liability for this transaction should remain with the Issuer for chargeback reason codes covered by Verified by Visa.
7	CAVV failed validation; attempt (US issued cards only)	Please check that you are following the VBV process correctly and passing the correct data in our transactions. Provided that you have implemented the VBV process correctly the liability for this transaction should be the same as an attempted transaction (ECI 6)
8	CAVV passed validation; attempt (US issued cards only)	The CAVV was confirmed as part of the financial transaction. This transaction is an attempted VBV transaction (ECI 6)
9	CAVV failed validation; attempt (US issued cards only)	Please check that you are following the VBV process correctly and passing the correct data in our transactions. Provided that you have implemented the VBV process correctly the liability for this transaction should be the same as an attempted transaction (ECI 6)
A	CAVV passed validation; attempt (US issued cards only)	The CAVV was confirmed as part of the financial transaction. This transaction is an attempted VBV transaction (ECI 6)
B	CAVV passed validation; information only, no liability shift	The CAVV was confirmed as part of the financial transaction. However, this transaction does qualify for the liability shift. Treat this transaction the same as an ECI 7.

41. Appendix P. Basic Transaction Receipt (Non Track2)

For all regular credit card transactions (card not present), the credit card associations expect certain fields to be presented to the cardholder on a receipt.

	Field	Description
1	Merchant Name	The name of the store / business.
2	Merchant URL	Web site address of the store / business.
3	Transaction Type	<p>The type of transaction that was performed:</p> <ul style="list-style-type: none"> - Sale (Purchase) - Offline Sale (Force Post) - Authorization (PreAuth) - Authorization Completion (Completion) - Sale Void (Correction / Purchase Correction) - Refund <p><i>NOTE: The terms listed above are the names for transactions as they are to be displayed on receipts. Other terms used for the transaction type are indicated in brackets.</i></p>
4	Transaction Amount	The total amount being paid by credit card.
5	AVS / CVD Result	The result for AVS and CVD verifications are one alpha character. This character will indicate if the verification was performed or not by the merchant or the Card Associations.
6	Transaction Date and Time	The date may be in any format, but must include the day, month and year. The time must be in 24 hour format. It is good practice to include the seconds in the time format to help with tracing transactions.
7	Reference Number	<p>6400135 = terminal number 001 = shift 001 = batch number 001 = sequence number 0 = reserved</p>
8	Auth Code	The authorization number is only printed if the transaction is approved. If the transaction is declined, the title is printed but the field is blank.
9	Response Code	The 3 digit response code returned by the issuer (ex. 000 – 999)
10	Response Message	Message indicating whether the transaction was Approved or Declined.
11	Cardholder Name	Display both First and Last Name as submitted by the cardholder.
12	Goods and Services Order	A list of all items/services that are being paid for in this transaction.
13	Return Policy	The refund policy is only a requirement for e-commerce transactions.

44. Appendix S. ACH Transaction Receipt (Check Not Present)

For an ACH transaction, a transaction confirmation is not mandatory; though eSELECTplus does recommend that a receipt of registration of the transaction be provided to the customer. Below is a list of recommended fields and the format they are to be displayed in.

	Field	Description
1	Merchant Name	The name of the store / business.
2	Merchant URL	Web site address of the store / business.
3	Transaction Type	<p>The type of transaction that was performed:</p> <ul style="list-style-type: none"> - Check Sale (ACH Debit) - Check Refund (ACH Credit) - Check Reversal (ACH Reversal) <p><i>NOTE: The terms listed above are the names for transactions as they are to be displayed on receipts. Other terms used for the transaction type are indicated in brackets.</i></p>
4	Payment Type	Indicate that this is an ACH processed transaction.
5	SEC Code	Specify which SEC Code was submitted. Identifies how the bank account information was collected. i.e. WEB – Internet Initiated Entry
6	Transaction Amount	The total amount being debited or credited to the bank account.
7	Transaction Date and Time	The date may be in any format, but must include the day, month and year. The time must be in 24 hour format. It is good practice to include the seconds in the time format to help with tracing transactions.
8	Reference Number	6400135 = terminal number 001 = shift 001 = batch number 001 = sequence number 0 = reserved
9	Auth Code	The authorization number is only printed if the transaction is approved. If the transaction is declined the field may be omitted.
10	Response Code	The 3 digit response code returned in the transaction (ex. 000 – 999)
11	Response Message / Result	Message indicating whether the transaction was Registered or Failed to Register.
12	Account Number	Customer's bank account number. All but the last 4 digits of the account number must be masked out.
13	Routing Number	Check routing number to identify the Financial Institution.
14	Check Number	Used for check tracking purposes.
15	Account Type	Indicate whether this is a Savings or Checking account.
